Interesting reading Bob's Marine Corps Marathon 95 "Hot Wash".

I have been a APRS owner for about 2 years now. I was unable to "volunteer" to help. (I don't have a C-64). But, I was able during the race at times to watch APRS from home, 15 mile south of DC, and hear the two 2meter medical repeaters.

Hearing the medical repeaters, at least to me, it seems that HAMS were invaluable! Med boxes were sent here and there, status of medical support, the musings of "TOP DOC" were worth the price of admission.

The only down side that I heard was once and awhile near the end, it was clear that some hams came with just one ht battery...and it ran out.

I have attended a few of BOB presentations to HAM groups around DC. He has said that we do NOT need to put out so many GPSSs. DOn't need on all vehicles he said.

Watching APRS, listening to the 2m net, and on commercial TV was a trip.

Bob, many of the issues you talked about are issues to hams overall. Is it ok to put your Hot Wash on CompuServe and elsewhere as is?

APRS at the Marine Corps Marathon 1995

1995: This year we had fewer GPS trackers and relied almost entirely on the Dead Reckoning features in APRSdr.EXE. This program can dead reckon objects along the marathon route without operator intervention except when needed to correct for long term drift between the runner and the Dead Reckoned object. The LEAD runner goes about 9 Knots and the Tail goes about 4 Knots. Also, these tracks DO follow the exact course, where GPS vehicles often do NOT reflect the real path of the runner (where vehicles are not allowed). We also DR'ed the lead Handicapped, Woman, Special-Olympics and PACK. See DR.txt.

MASTER-SLAVE. This year we also operated three 486 color laptops and two larger VGA displays all connected to the single APRS TNC. Only one laptop was operated by the APRS operator as MASTER, and all other laptops were placed in SLAVE mode in front of the other voice net controllers, so they could independently zoom in to areas of their immediate interest. If we had had more VGA monitors, each laptop could have also driven an extra large display. The small size of the laptops fit unobtrusively at the operating positions. See OPS.txt.

IMPRESSIONS: This year was dissappointing compared to last. The 70 + HAMS who have always been the ONLY dispatch authority for the last 18 years and who had always done an OUTSTANDING job, were surprised when they started directing ambulances and found they were already moving under other authority. Apparently, with the new 800 MHz radios out there, the variety of ambulance companies could ALL communicate with the County dispatcher.. In the past, each ambulance company had their own radios and could NOT communicate except via a HAM rider. This year not one general, doctor, or person in distress ever popped into our tent to get the latest (a CONSTANT occurrence in the past). Even the Marine Corps had cute little commercial HT's instead of the hoot-n-holler field phones they used up to last year!

Overnight the HAMS slid from HEROES to a footnote... The mood in Net control was gloomy.

What this tells me, is that TECHNOLOGY MOVES ON... HAMS have always prided themselves on their emergency response, primarily because of their frequency agility. But with programmable radios EVERYWHERE, the HAMS no longer have an edge. We have had programmable HT's for 15 years... Now that everyone else has them, what NEW can HAM radio bring to an event?

How about APRS?

Good question. But how many years will it be until most HAMS that get out there at 4 AM will trade in their commodore 64's? We had only 5 GPS trackers show up this year vice 11 last year, and fewer than a handful of APRS ops. With my 6 screens, it still looked impressive in Net Control, and the one screen we placed in the Marine Corps tent had a Lieutenant GLUED to it the whole event as if it were a crystal ball... but it was a facade. I was the only operator that had ever touched APRS. (The other few APRS ops were out on the road). We just havent gotten the attention of the EMERGENCY RESPONSE HAMS in the area.

I do not solicit APRS for these local groups since that would appear to be a conflict of interest for me, but in those area where at least ONE person on the INSIDE of the EMERGENCY COMMS groups has gotten turned-on to APRS, there seems to be a lot more success... But I still have not seen any APRS articles in the major ARES publications...

Get those operators TRAINED. With a multiple SCREEN setup, you only need ONE good APRS operator at the MASTER, but everyone in the emergency response team, should be familiar with the basic CURSOR, ZOOM and MAP display. The P and L list also come in handy... Good luck guys!

>talk, reminiscing, flying decades old missions, and using "ham-speak"!)

I can relate to this. A lot of net controllers and public service volunteers
need to learn to "say it and shut up".

SOmeone asked to further distribute my musings on the MC Marathon. I
would prefer not. My comments were only from my very nearsighted digital
view, and I dont think it represents an overall view.

HAM radio was a VERY POWERFUL contributor to the marathon, and the small
army of HAM radio volunteers did a great job. HAM radio at the MCM
was a success!

Its just that it seemed different this year...
I would prefer to hear what the final wrap-up sounds like after all of
the info has been digested by the organizers.. WHO PUT IN 100 TIMES
more effort than I did...

My musings were only from a digital perspective... and beyond that,
need not generate a lot of general PUB-SER comments onthis SIG...

I have been reading , with great interest , the comments about the
Marine Corps Marathon. Living in South Florida, (hurricane central),
I would like to share some thoughts on my experiences both with hurricane,
and with special events that come up. (with a digital perspective)

#1 Hurricanes:

Packet was used extensively to push H&W traffic as well as important
info out of the area. Ham operators really came through. This is it...!
Plain and simple..we helped alot. APRS has the potential of aumenting
this even more. BUT please look at the special events comments:

#2 Special Events...

I have participated in about 5 special events since I have been a ham. Many times I am really embarrassed at the way other hams show up for work. Putting it simply, 1st impressions mean alot. When you see a shabby, derilict looking person with a radio, it does not instill confidence in what we do. As Ambassadors, we must appear proffesional, act professional and BE professional. Ive seen guys, as soon as they arrive, go rummaging around the feed tent looking for food, like scavengers. Dirty shirts that look like they just changed the oil in the car, severe body odor, and other atrocities are frequent. I go out of my way to find folks that want to be thought of as communication professionals, able to improvise and solve any communications problem that may come up. Maybe I got this idea having served as a Navy Corpsman with the Marines for several years. WE should look like communications PROFESSIONALS. Anyway, the return invites are declining. I really think folks can get embarrassed by our presence. The whole point is this: IF you have the honor of serving, be sure you try to reflect proudly on what you do. This doesnt mean wearing geek badges around your neck and slinging along 20 HT's so you look like your in charge, it means DO YOUR JOB, and try to appear trustworthy ! (i.e. take a bath and wash your shirt)
(although radios with lots of knobs and buttons help)

Digitally speaking, APRS I still believe has alot to offer. IT is an adjunct to regular voice communications. I think that it is up to us to guide Bob and tell him what our needs are. Give suggestions, give feedback. Lets let this program mutate into a better and better system. We need to invent, we need to dream up new ideas, we need to create a better and better system.

For what it is worth, I and another ham are building a remote control blimp with ATV and APRS system. It's loiter capability should provide an interesting show during these type of events.

Dont be just a user...Give feedback to our people who write these farsighted programs. Remember the hams of old, how inventivness was the standard of the day.. Heck we cant even fix our own radios anymore !

I'm done... Flame away..
Mike KD4EMI

417. Cows In Space update

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Tue, 24 Oct 1995 18:58:49 -0500 (CDT)
To: aprssig@tapr.org
Message-ID: <199510242358.SAA02180@solar.cs.tamu.edu>
Rendered body type: text/plain

Just thought I'd let you guys (and gals) know where we "stand" with Cows In Space. For those unfamiliar, I'm involved with a research project that's using GPS trackers, with realtime and subsequent post-processing, differential correction to track a fully instrumented herd of animals around a 400 acre pasture. We're intersted primarily in the animals' interaction with the ecology, including feed and forage and insect infestations.

Last week, we put a number of animals in the field. We had some successes, and some failures. Tomorrow I hope to have a handle on some more of the failures and their modes, but it's known that:

1. One of the custom made GPS trackers got too hot to touch as soon as plugged to power... lithium D cells for those who're interested... and was not working later.
2. The differential Station we used to generate RTCM SC-104 output did GREAT. Except that it put something else out too, and confused the heck out of the Motorola OnC0re receivers.
3. 5 of the trackers failed for currently unknown reasons.
4. One of the 2 fixed sites that we use for check and post-processing data appeared to be programmed correctly and emitted exactly ONE burst of packet data after power was applied. More troubleshooting.

All of the battery packs still had juice when collected at the end of the week. The data collection period was foreshortened because of other problems we had at the front end, necessitating about 12 hours of intense driving for me last Tuesday (Texas is not a small state!).

The TNCs always transmitted a LF character when sending out the GPS data. No

reason we could find, and PacComm are working on what happened. I have some thoughts but will share those with Paul later, AFTER I've characterized it some more.

We have good data on those cows we got any back from. We wre collecting data at 15 second intervals. That turns into a *LOT* of data over th course of a week.

Oh, and APRS worked just fine. Bob, we need to talk about a couple of things, but that can wait. the NMEA log fx was a lifesaver. I've about got the post-processing done, and expect 2 meter error or less!

I'll post a map of Lacopita Research area (or at least our little piece of it) and a subset of the cow data sometime in the next couple of weeks. We have to get some publication out with the first dataset before we release data anywhere...

-- [From: Robert D. Swain * EMC.Ver #2.10P] --

Mike and the group (I'm trying to keep this APRS oriented),

"Flame away", you say Mike... Well I can't flame comments like that! In fact, I couldn't agree more!

I am amazed each time I show up at a ham club meeting to demo APRS or DFing. I realize we are doing this on OUR time and at OUR expense but c'mon...is it too much to ask to wear CLEAN clothes?

Unfortunately I think part of our image problem stems from our name - AMATEUR. Often I find myself saying HAM operator instead... this goes only slightly further than the previous. I understand WHY we have those titles, and I am PROUD to be part of it all, but look at it from the outside world... would you rely on an AMATEUR mechanic to fix your car? Would you take your children to an AMATEUR doctor?

In title alone we loose much of our credibility. If you didn't know any better, which would you choose - amateur radio or a radio group called REACT? Hummm

We radio operators always have and always will have much to offer the emergency services. We need to get involved. When I give an APRS demo, there are always people in the crowd that have seen it, used it, or know more about it than myself! Why then does it take a visitor like me to "introduce" a new tool for us to use? Seems like SOMEONE would have already done a demo. I'll bet you'd be surprised how many clubs have not been ENLIGHTENED yet.

We need to get going and kill this negative trend before it gets worse. I'm not simply crying wolf here. We have already collectively lost the ability to build a radio, we loose frequencies much too often, and what help we were providing seems to be slipping through our fingers. It won't be hard for the FCC to divide the rest of our "land" if we don't use it for what it was intended.

Are we doomed? Certainly not! We of all people can get our act together in short order. Next time your at a ham meeting, offer to bring some new idea next month. Next time you check into the net, don't say "in and out". We have plenty to talk about and PLENTY of RF "real estate" to do it in! Let's use our talents and refine our skills before we too are talking about the "good ole days" of radio.

As for the marathon, I'm as guilty as anyone for sitting home that weekend. I have a full complement of gear that would have been put to good use.

I'm sure I'm speaking to the choir here but we have to start somewhere....

As he said, Flame away!
Robert, N7LUE

I realize that this has not much to do with APRS , but I have to agree with
this statement. If we are to prove to the community what a resource we are,
we have to look like we know what we are doing ...

Just my two cents worth ..

>Comments:

Use a MFJ cable from KPC3 to Icom IC2A. Using a VoCom Power Pocket amplifier to supply power to the HT and give it a 20 Watt output to a 5/8 wave Antenna on a NMO hole mount. With RCA plugs on the GPS wire this gives flexibility to adapt this to us on a laptop later. Power thru the DB25 supplies power to the KPC3 and the GPS45. I picked up the IC2A at a hamfest for \$80 (the guy swore it worked, just the battery was dead) turns out it transmits fine but doesn't receive (I'll try to fix it later but there is no hurry, the tracker just has to yell "Here I am!!" Right?) I picked up the VoCom at another Hamfest for \$20. Purchased the GPS45 from E&B Marine for \$350 including cable, mount and shipping. GPS45 is mounted above my C5718 remote head so it is easy to see when driving. Also using a Motorola active antenna on a mag mount. (Wish this would screw onto an NMO mount.) KPC3 is one I picked up at a Hamfest for \$105. Total investment is about \$730, the GPS and antenna make up over 60% of that.

Unless someone snuck in a GATE on me and didn't call it GATE, I captured a couple of nice catches early this morning!

Maybe It happens "all the time", but I have never seen it- not even during my thousands of meteor scatter xmissions.

On my screen and P-List here in Atlanta were the following stations:

N2MSM-14 and his Ultimeter-II WX station
the P list time/date was 240452 and his path was N2IPH-15,W2HOB-15,Wide,Wide*

WA2JNF-4 Digi in Brooklyn at 240351 using the following path:
Wide,Wide* (nice one!)

"Big Daddy" Bob Bruninga's very own RELAY digi WB4APR-1 in Annapolis, at 240401
It used the path: WIDE,WIDE*,W2HOB-15,WIDE

and

N2NYZ using the path WA2JNF-4,WIDE,WIDE*,W2HOB-15,N2IPH-15,WIDE

Good job, all you Northerners.

GO BRAVES!!

I must agree with the write.. I hate to admit it but it is true.

Not only a functions where they are "working" but too often at club meeting, ham fests ect. Far too many hams just don't seem to care to make a good impression.

Of course, this is a minor part of the ham population. Most hams are clean, well manered and well spoken but the few make a poor showing for all of us.

I'll post to the group when the preprints are ready. Really. After all, it IS the modern communications age.

I was up at the office getting the first presentation on Cows In Space finished or a GIS symposium invited presentation on Friday. After that, if the PI agrees, I'll post a couple of hours of data and the map. Oh, yes... I'm getting to scoop the PI on this one. And he's even being graceful about it! I'm giving the first paper, and it was invited!

Actually, it's usually (and more correctly) called "anomolous propagation." The term "tropo" is not just real good as a descriptor of what is really happening... I would guess he saw Ap across the line of that cold front

pushing east, but I'd have to look at some wx charts to make sure.

>
> The boys up north should have seen you on the screen as well.

Not necessarily. AP (or ducting) can easily be one way. It's a fairly interesting phenomenon. We spent quite a bit of time on the subject studying AP when I was learning about radar... The frequencies are different but the concepts are the same from about 120 MHz on up.

Having added the ULTIMETER-2000 code, I was looking for any other things on the TO-DO list to add for version 74. I decided to take another stab at the BUS MOUSE.... And with a little help from WK5M, Karl.....

IT WORKS! (on my laptop anyway)

It is all finished and bug free, but I added it to an old smaller copy of APRS to debug. Now all I gotta do is move it into the main APRS and it should be out in a day or so... But if I encounter any problems, then it will be more than a week, since I am headed to Atlanta for my 25th reunion at GaTech this weekend... (1 watt GPS mobile only).... and NO time for HAM activities...

I have participated in about 5 special events since I have been a ham. Many times I am really embarrassed at the way other hams show up for work. Putting it simply, 1st impressions mean alot. When you see a shabby, derilict looking person with a radio, it does not instill confidence in what we do. As Ambassadors, we must appear proffesional, act professional and BE professional. Ive seen guys, as soon as they arrive, go rummaging around the feed tent looking for food, like scavengers. Dirty shirts that look like they just changed the oil in the car, severe body odor, and other atrocities are frequent. I go out of my way to find folks that want to be thought of as communication professionals, able to improvise and solve any communications problem that may come up. Maybe I got this idea having served as a Navy Corpsman with the Marines for several years. WE should look like communications PROFESSIONALS. Anyway, the return invites are declining. I really think folks can get

embarrassed by our presence. The whole point is this: IF you have the honor of serving, be sure you try to reflect proudly on what you do. This doesn't mean wearing geek badges around your neck and slinging along 20 HT's so you look like you're in charge, it means DO YOUR JOB, and try to appear trustworthy ! (i.e. take a bath and wash your shirt)
(although radios with lots of knobs and buttons help)

Digitally speaking, APRS I still believe has a lot to offer. IT is an adjunct to regular voice communications. I think that it is up to us to guide Bob and tell him what our needs are. Give suggestions, give feedback. Let's let this program mutate into a better and better system. We need to invent, we need to dream up new ideas, we need to create a better and better system.

For what it is worth, I and another ham are building a remote control blimp with ATV and APRS system. It's loiter capability should provide an interesting show during these types of events.

Don't be just a user... Give feedback to our people who write these farsighted programs. Remember the hams of old, how inventiveness was the standard of the day.. Heck we can't even fix our own radios anymore !

I'm done... Flame away..
Mike KD4EMI

Well said, Mike!

We are as much public servants as any politician - and there are plenty of the latter after our frequencies. Looking like scruffy bikers does NOT endear us to those in a position to influence the politicians, and acting professionally is 80 percent of being a professional.

Bob,
Possibly you should give some more thought about expanding the different screens from their present 5 screens to 10 or more. If the memory required is too much, make it to be able to toggle on and off or save and read the lists directly from the disk drive using a temporary file that gets deleted when the program is terminated. (unless you use the F S option) Another option to save memory may be to call in different parts of the program as modules, only when they are activated, such as meteor scatter, DF, DX Cluster, etc.
Obviously, I am not a programmer, but there must be *SOME* way that this can be done. If I was in the enviable position of routinely getting all five screens full, I assume that it would be very frustrating to know you have reached the limit.

You are possibly right in having a long haul path, WA4JNF-4, W2HOB and WB4APR are BIG powerhouse stations. Not that they run a lot of power but they are located at a few very well chosen sites.

The other possibility I see from studying the paths is that someone in the Annapolis area could have by mistake set their MYGATE to WIDE. All of the above stations can be seen in the MD/VA area with a correct path (which they had). Anything with a WIDE in the path would have gone out on HF and bingo instant Skip!

I originally started in the NJ APRS group and visited in September with APRS in the car from FL to NJ. Once we got in Annapolis range all of those stations stayed in mobile coverage for most of the trip ending near NY. In most probability someone messed up for a little while hi hi.

The GATE filter is great here in SFL we need it sometimes with the amount of activity we have!

As far as the GATE filter yes, that would have cleared up the GATE variable but how about a GATE that is really "WIDE". Correct me if I am wrong but the GATE filter suppresses any station that comes along with GATE in it's path. If it came along with WIDE in it's path through a GATEWAY ALIAS of WIDE it would not suppress anything, correct ??

Don't get me wrong I love 2 and 432 openings I have been a avid DX'er on VHF and UHF for many years but let's not get too excited just yet! It CAN happen, I have worked FL from NJ and NJ from FL on 2M SSB with 80W at 40ft but it is not common, let alone on FM.

436. Tracker Data

TNC TYPE: KPC3
FIRMWARE: 6.0
GPS: Trimble Acutime smart antenna
Interface: Direct to TNC through Null Modem cable
Comments: The WA6MHZ APRS Tracker is mounted in the trunk in a Tuner box and is independent from the Vehicle, as it uses a 18AH Gel Cel for power. Radio is an old Santec HT which runs into a Kantronics 2-30W HT Power Amp on during drive times. A special timer circuit was designed so that while the auto is parked, the APRS system is only active the last 2 minutes of each ten minute period. This allows the auto to stay on the map without alot of channel QRM. The circuit also turns the GPS Rcvr 3 minutes early to allow it time to acquire sats. This cuts down battery drain by almost 70%! During drive time, 12V from the ignition enables the circuit for continous spots and also recharges the Gel Cel. Everything is easily removed on a momments notice and allows setup in other vehicles. The Trimble GPS is a Mushroom type unit with no display and only NMEA0183 data out (\$GGA sentences). It sits on the rear window shelf of the car and gets excellent results there. These units were purchased by many of us in San Diego on a special deal used for only \$70!!! Bet the rest of the APRS world would KILL for a deal like this! The Trimbles outperform the Garmins and others tremendously, but without the whistles & bells. For APRS use they are ideal! We will be demoing APRS and the mobile Trackers to a large crowd of San Diego area Hams at the Ham Radio Roundup on Sunday Oct 29th, so expect to see even MORE hams on from the Southwest! For those who read this in time, it will be at Convair Missile Park near HRO in San Diego. 73 and C U on the MAP! Pat WA6MHZ, ARRL San Diego Section Manager

Rich, N2CZF said that maybe someone in the Annapolis area could have set MYGATE to WIDE accidentally, placing any station with WIDE in its path out on HF. I am not too familiar with GATES, but wouldn't my GATEfilter have filtered out the incoming GATE on my side?

Bob Wilkins sent me the following forwarded message that may explain my L O N G haul APRS. I kinda thought he might post it here, but since he didn't I will.

Ralph

Subject: Connecticut TROP0 report

BIG Tropo on 2m through 1296 last night Oct.23 and this morning Oct.24 !

Started w/ KF4AMB FM16 at 2325Z, then WD4IXD EL98 and W4EMB EL95 on 144. Indeed, by morning I had at least 2 dozen Florida stations alone in my log on either 144, 222, or 432. Plus numerous GA, SC and AL Qsos. Best 144 dx for me was KE4NJM EL94 (FL Keys) at 1270 miles. Had exciting 432 qsos w/ N4TAE EM90, WD4IXD EL98, N0KBH & WA4CHA EL88. New grids on 222 w/ NI4Z EL98 and WB4JEM EL89. Most exciting to me, though was KP4XS EM84 on 903 and 1296 and NA4I EM83 on 1296! Love it!

[BOn Wed, 25 Oct 1995, Jan A. Barglowski wrote:

> Will version 74 contain the DR code that you used in the MCM?

ANSWER: NO. 74 hopefully should be the new baseline from which I can now build the followZAing:

APRSdr
APRSdx
APRSwx
APRSgps

But since 74 is still a full up version and is only 373K, down from a high of 410K some months back, maybe I dont need to make smaller versions? Is anyone still having memory problems? 74 is 1K smaller than even 73d..@..

PS. The following files are being uploaded to FTP@tapr.org in the directory tapr/SiG/aprssig/upload. Should be finished by 2100 EDT

72cto74.zip
73dto74.zip
aprs74.zip

The mouse code I used said it might not work with HERCULES and/or some CGA displays...

In RE: to my last message there also is a GATE in Central/North NJ which could have been an outlet. That station has been on for a long time and knows better, the only possibility that the signals came from a GATE on the NJ side would mean that he messed up by mistake.

Reason I think it is possible is that the GAT's location in NJ can hear WB4APR-1 with little help with propagation. It is right on the border of being heard with 1 WIDE and if there was a slight opening APR-1 could have made it directly and then out on HF with it's 1 WIDE, IF MYGATE was set to WIDE.

After reading more condition reports I am swaying more towards a fantastic opening. Seems that conditions were very good, but do remember nothing is failsafe when it comes to TNC parameters.

I have set MYGATE to WIDE on 2 occasions in the past, 1 was for the ARMY-NAVY Football run about 3 years ago on 40 so W3ADO could copy position reports if VHF failed (runners were going out only on VHF). The second opportunity was when Brothers TO the Rescue flew their first flight with APRS in International/Florida waters looking for rafters. Now "BTTR" flys about 3 times

a week and use GATE on occasion, no need to create a possible mess with MYGATE as WIDE.

Hello I just downloaded a copy of APRS74, and the new "any" mouse support is great! Now I can play with the mapmakeing stuff like a real mouser.

Thank you "BOB" "WB4APR" I shure appreciate your contributions to my hobby!!

73 Charles

p.s. We have new digi in Lynchburg "Russ, WA4BWB" on Tobacco Row Mt.
Also I heard a rummor of a Roanoak Digi too.

?????? When using the Pacomm as a stand alone tracker, the output is to; the unproto of GPS XXXXXX . I don't see a way to change this so my location would be rebroadcast (wide, wide). I would like to track my mobile, on home pc when I am beyond the range of my home QTH.

When an APRS station recieves a GPS position, it does not retransmite the data unless manually uplinked, is this correct ?

Hey guys,

It was inappropriate to upload the file attach to the sig. Many siggers pay for the time they are on line. Hundreds of siggers just download that file whether they wanted it or not. All who use listserv's such as this should use alternate means to get file attaches to another party--either directly via e-mail to the other party or via an intermediate ftp site such as tapr.org if the file will be of interest to all of us (as this one may be). In the case of this file, use of tapr.org and a message to the sig that it is there for testing would be the best method.

No flame, just a little education for all.

I received the following message from Joe Agrello about their test run of their new DF unit which will be APRS compatible...

From: JAgrello@aol.com

DFjr test results:

We did a breadboarded DFjr. feild test this weekend, WOW!! it was awsom. We put together a nice little package with a HPVFC (800 milliwatt version of the VFC400) and a Micro-1.4 (voice recorder) for ID, attached it to a car and let them drive away 16 miles to an unknown location. As we proceeded to obey the intellegent DFjr's display, it ignored multi-path all the way, just like it was suppose to, we just followed the LED's and within 20 minutes we passed the street where the fox was, the LED's swung around the display as we passed the street, time to turn around, then we turned down the street like DFjr directed us to and the same thing happened as we passed the house, BINGO! there it was parked in the back of the house. Total execution time was 22 minutes.

Conclusion: the DFjr displayed no mercy.

Much interested in new DFing techniques. Is there any additional information on the DFjr system? Where and how do I get one? How much does it cost? DFing is very important - a tiein to APRS makes it doubly so!

Waiting eagerly....

APRS 7.4 keeps crashing while running in DOZ mode and Windows 95.
7.3d runs fine.
Anyone else having this problem?

See Ya
Demos

I have a 512K HP95LX palmtop. By minimizing the RAM disk, the largest RAM memory is 330K. I have thought about running portable APRS on it (expecting that I won't get much of a map with the simulated EGA screen, half displayed at a time).

So a minimum memory APRS may still be useful.

Yes, it crashed half a dozen times the first day on one of my 386SX16 machines with Windows 3.1. Always happened in DOZ mode. But it runs fine on another identical machine! (I have one at home and one at my office) Something about error number 5... I'll capture it next time so I can post it for Bob.

Gerry ,

I thought it was called "Cow in Space" because when the cow's GPS position is plotted for the vertical axes they seem to be levitating.

Please let use know more about the battery life and any heat problem for the sealed units. Let is see some data when you can.

You are one person we know is "outstanding in his field"

No.. I never use the DOZ mode... I will try it... See if it crashes here..

Sam - WJ8T.

457. Re: [APRSSIG:4043] More Cows In Space updates please

APRS stations on the air.

I've re-adjusted my TNC to use 4800 baud with the computer in order to see if that helps improve stability any. (The jury is still out.)

The most serious problem I have at the moment is the program crashing -- almost always within an hour of my starting it up. Here's what I did last night before going to bed, and, as half-expected, it crashed probably about the time I did. :-)

Fire up APRS. Alt-S/Modes/DxClustr, space_bar to draw the map, then let 'er sit. But I think I've seen the problem other times too.

Before long, the screen looks like this and you're a gonner:

```
--- cut ---
Rng8192 Nmiles                At 0049 ToGo:B>9 P4m
***t 48 24.00N                Mode is set to DXclustr
LM,PM: 1      -1              Move cursor to your QTH with
a,I,J,K,fdx,LDx: 75  8  1  53  0  12  (shft)arrows, NumLok off and
X,Y,X1,Y1 108.9285 124.2188 108.9285 124.2188 (ctrl) PgDn. Then press I M
A$DB0EQ*>DG3IAP-1:> SCHULE...118 26.10.95 DL 352 365 CQ Schulstationen
c$
ESSIn MyCall:j= 16 and TL=0
OOOPS! ERR number 5 Hit ENTER to return to DOS?
```

[world map here]

```
DX de 0Z8Q:      1830.7 3V8BB      SSB      2344Zeeps
Bcn:DB0EQ      270049 n DL3NY - Theo
DB0EQ*>DG3IAP-1:> SCHULE...118 26.10.95 DL 352 365 CQ Schulstationen
--- cut --- (above screen typed in (copied) by hand) ---
```

Again, 438.3 MHz here is a very busy freq. (typ. 200 - 900+ % "Channel Load" according to APRS!), but I'm not sure if that's related. (How is the Channel Load calculated anyway?)

And some other problem reports/comments:

I often get the message "Comm-buffer-overflow" in the upper-right corner of the screen. I've seen this message not only when I sit "idle" (more than a few seconds) at a yellow-boxed program prompt too long, but also sometimes at program start-up (i.e., I took more than 3 to 5 seconds to answer the start-up questions for unregistered users???), and at other times too. This is not a fatal error, just a disconcerting one. ;-)

I've experienced other fatal errors too, but found that in many cases it was due to my own inexperience with the software (it takes a while to "learn" not to crash it -- ha!). For example, if I edit a maplist or map file under UNIX/Linux and forget to convert the line-endings to DOS-style, APRS will crash with a cryptic but fatal error (Err 11 I think), etc. Perhaps I will try to document these situations more in the interest that maybe someday we'll have fool-proof program.

How 'bout a file in the APRS distribution called BUGS.TXT or something, with descriptions of known bugs, known workarounds, or even common config/usage problems by newcomers?

Finally, though you might get a different impression from this rambling posting, I'd like to congratulate Bob and the other key people on their work. Bob has written a truly impressive program in what appears to be BASIC, and I realize that many limitations of the program are in fact limitations of the programming language. I admire Bob for taking the resources and knowledge that he has and forging ahead full speed. Thanks!

Vy 73,

--Shannon, DL6SEU (AKA N7APC)

On my way to becoming "hooked" on APRS, near Stuttgart, Germany. ;-)

Phil Stated

I have a 512K HP95LX palmtop. By minimizing the RAM disk, the largest RAM memory is 330K. I have thought about running portable APRS on it (expecting that I won't get much of a map with the simulated EGA screen, half displayed at a time).

I too have an HP95LX that I hope to run APRS on in the future. I read (on the sig) that someone had succesfully done this. I also have a couple of PC-JR's with 640 base mem and 360 floppy no HD. I will try to make ramdisk large enough to squeez in APRS. PC gurus can I use the append comand here, so I can use ramdisk and floppy together ? Perhaps there is an old version of APRS that will fit on a 360 k floppy ? Or meet the 330 k requirment for Phils HP95.

Charles

To All,

The DFjr is a very intelligent microprocessor based Doppler. The DFjr is the reward of two years of dedicated hard work. When we first began this project in 1993 we realized that there wasn't much improvement to be had in Doppler technology, because of multi-path, and the LED displays swinging all over the place. There was a big learning curve and far from plug-n-play for anyone.

So what if we added a powerful microprocessor that realized a multi-path signal, and took samples of the incoming signals and only lit a LED that corresponded to the best sample, hmmm. Well, that's what we did. Since we have the microprocessor we thought "let's take full advantage" and did. The DFjr has three pushbuttons on the faceplate MENU, SUB/-, and ENTER/+, in these menus we have the ability to set the sample rate, output baud rate (1200,2400,4800,9600), calibrate, data/out format (APRS/NMEA style including the bearing and quality factor, Raw Continuous Bearings only), etc...and store these settings in a EEPROM. The RS-232 output is via a modular-6 type connector including a modular phone type cable and modular to DB-9 adapter (like the PicoPacket).

The DFjr runs off a vehicles 13.8 volt DC supply. Size is 4-1/2" x 2-3/4" x 1". Includes four magnet antenna's with wips for 2 meters, 220 and 440 (custom made). 3 different antenna switching units will be offered as a plug in module (PCB), due to component value changes for different receiving bands (no other way around this). All cables, connectors, antennas w/wips, and choice of 1 switching module, for a price somewhere in the range between \$199.95-\$249.95, still need to tally up the costs.

Since I know everyone is just as anxious as I, the scheduled availability for production runs will be around Christmas (just in time for MacAPRS for Windoz), and the first 10 beta test units sooner, sorry the 10 beta's are already promissed to:

- 1) ME-Mobile (N200C)
- 2) Joe Moell (K00V)
- 3) George Chapek (N2AIG)
- 4) Robert Swain (N7LUE)
- 5) Ed Rogers (N9LCI)
- 6) Keith Sproul (WU2Z)
- 7) Mark Sproul (KB2ICI)
- 8) SARA (K2AE)
- 9) ME-Home (N200C)
- 10) Agrelo Engineering

So don't ask.

To see pictures and stuff, check us out on the web at:
<http://home.navisoft.com/agrelo/ae.htm>
Please be patient this page is under currently construction.

Thanks to all with interest and support.

Plug-n-play all the way.

I can certainly verify that there was a big time band opening at VHF and above on 10/19,
10/20 and 10/23, and perhaps other days as well. I heard a lot of distant ham and
public safety systems on these days while working in the DC area, as well as Cape May,
NJ and Lewes, DE. It was actually driving me nuts, at the time I was trying to
field verify the suitability of some frequencies that we're planning for a police radio
system.

I have noticed a few messages on the sig about the file that was uploaded and
wanted to make my comment... Back off a bit, it was a mistake! Someone new to
the sig system was doing someone else a favor and uploading a file intended for
me personally, the program IS/WAS NOT intended for general distribution.

I have seen countless times personal messages intended for one specific person
go out to the whole sig, this is what happened in this case but unfortunately
this message had a file attached.

The server places aprssig@tapr.org, not the senders address in the REPLY TO
SENDER choice, that leads to a lot of problems if someone is new or is rushing.

Hi Joe,

You don't know me but I want to congratulate you on improving the doppler.

I have used the Doppler Systems doppler for about 6 years now with very good results. There is not too much led swing but it is bothered by multipath... much worse on horz signals.

Yep, I know all 10 bata units are assigned... However, if one becomes available after or during the testing I would like to try it here in FL. I would put up a deposit equal to the unit cost for your protection.

Please let me know when they are available for purchase.

Thanks for your time.

Joe,

Some of use don't DF for fun, we're out looking for ELT/EPIRBs. The capability to work 121.5/121.6 MHz would be very valuable. At least give us the info/capability to build our own modules to track these signals. Otherwise it looks like you have done an outstanding job!

Respectfully,

Jay

Aloha de Dave/WH6YC. I'm excited to report that we now have two APRS GPS standalone trackers on the road here on Oahu, Hawaii. They are Mel/WH6UG, driving the Oahu Civil Defense mobile command post, and Lawrence/NH6NJ, in his personal vehicles. Both stations are using Trimble GPSs and KPC-3s with one minute position updates on VHF, and 10 minute position updates via the Oahu HF Gate. I'd appreciate the SIG watching out for position reports from either of these stations. We occasionally copy mainland mobiles and maritime mobiles via HF here in the Islands. That's it. And I'm not going back to the beach, since it's dark here. That'll have to wait for tomorrow. Aloha y'all.

-- [From: Peter Gross * EMC.Ver #2.3] --

The w7lus hf digi will be in the tnc only mode, beginning the afternoon of Nov 3,1995.

I will be going back on the road again! Am going to be "trucking" hauling electronics to all the 48 states and Canada. I do plan to be Aprs mobile on vhf as soon as I have the chance to install my equipment. If all goes right I also should be hf mobile around the first of the year, if not sooner. I do not have a laptop at this time so I will be tnc/gps vhf at first. When I come up on hf I will have a laptop on line therefore will have my mailbox active and will be able to respond to your messages when my vehicle comes to a rest. Don't expect a long real time session while I am on the move. We'll see how easy the F2 message sequence will work driving an 18 wheeler, , hi!

I hope I might be of some service for the betterment of Aprs or for some sort of experimental purposes while back on the road.

I am unmarried and will only get home every 4-6 weeks or longer, so please stay with me - it can get lonely out there!

At least now I can solve my curiosity of what is west of Kansas City on Aprs. Perhaps I can encourage or promote more activity!

I was just wondering if there is anyone running APRS in Colorado? If you are be sure to include wide in your path as there is a wide on 145.01 in NE NM on Seirra Grande. We also have a wide here in Amarillo TX. I regularly beacon posits ur direction on 01 but have yet to see anything from the N. See below for info on the above WIDES and we'll be looking for you in NW Texas.

Rendered body type: text/plain

I am wondering if there is anyone on the SIG in the Nashville area running APRS. If so I am in need of getting some questions about the activity over there answered. Recently I spent several days in the area beaconing WIDE, WIDE and was tracked by several stations in East TN. I only saw one station on as stand-alone tracker and the the beacon for the DIGI. Question, is there any other APRS activity in Nashville that I missed???

Took APRS on 1500 mile round trip From Wash DC to Atlanta and here are some of my experiences...

1) Remember you can FILE-REPLAY the DIGIS.BK file to overlay the location of all known APRS digis on your map without losing your current P and L lists. This was useful for checking the road ahead for possible digis. I FINALLY received info on the FLORIDA WDIES to add to the DIGIS.BK file but I think that there are lots more areas that have not provided us an update. NO EGO-PEATERS PLEASE.. Only PERMANENT WIDES!

2) I pre-loaded several messages to MSG so that I could reply to incoming messages using the F2 REPLY command and the new feature where using a single numeral key for a message, will copy one of the existing messages. This way I could chat with folks with at most 4 single key strokes... I saved a BACKUP file called M.BK, so that I could FILES-LOAD these messages each time I started up the PC by pressing just F-L-M. LEARNED: In later versions, I will make it so that an ERASE command will not erase the MSG messages until all ACKED messages have first been erased.

3) I preloaded WIDE,WIDE and RELAY,WIDE,WIDE paths under the path names of WW and RW so that I could rapidly re-configure my unproto path using O-D-WW or O-D-RW depending what kind of WIDE digi I was near...

4) THE APRS DISPLAY was adjusted so that it was CLEARLY visibile from the back seat. KIDS (ages 6 and 8) checked the display frequently, and instead of asking, "ARE WE THERE YET?" or "HOW LONG IS IT NOW DADDY?", they would only ask "Show ATLANTA" or "SHOW US WASHINGTON".

5) Since there was only ONE digi we found in 600 miles from DC to Atlanta, APRS was primarily used as just a progress and navigation aid. It performed well BUT:
LESSON: In the next version, I will let F3 and F4 be used to display MORE or FEWER labels. In my maps, I have always MINIMIZED the number of labels so that they don't crowd CALLSIGNS. But in the BOONIES, where there are no HAMS, I would like to bring up the lables for display at a higher range scale. This should prove valuable.

5.5) Typically I operated at 32 and 64 mile ranges to see our navigational progress. Zooming smaller was of little value.. (for an outsider just passing through). More TRAVELRES INFO on maps would be valuable. Such as showing all EXITS with lots of FOOD selections.... Also, Marking such exits with EXIT numbers...

6) INTERSTATES: It was nice to use MAPS-FEATURES-ROADS to suppress all roads on my MONOCHROME LAPTOP so that only the INTERSTATES remained. This made it easy to follow the interstate through congested map areas.

7) It wasn't that I got into the CENTER of ATLANTA and all the way THROUGH DC, that I saw any DIGIS. Made me realize that we should concentrate on PUTTING A WIDE DIGI near all INTERSTATE APPROACHES to big cities. Of course my lash-up for this trip was only running 1 watt AND HAD PROBABLY 20 dB of DESENSE from the TNC and ZENITH LAPTOP.

8) My laptop does not have dedicated HOME, PAGE UP and DOWN keys. This requires a TWO-KEY process, to hold down the FN key and an ARROW key simultaneously. No good for driving.
LESSON: In the next version, I will add U, D and H to the MAPS menu. So if you need to page-up, down, or HOME, all you do is hit M-U, M-D, or M-H. This will allow SINGLE KEY OPERATIONS... Actually, it won't be H because it is already used, but will be G for HOME, since usually this is used in conjunction with the GO command already. So it will become G-M-G to re-center the map on your CAR...

What's west of KC on APRS? Not much until you get to CA, but were working on it.

Ben W55R !3514.12N/10149.54W BenW55R@aol.com

Salt Lake City has APRS on 145.15 and 145.05 at the moment, with 145.15 being the more active. Unfortunately, we also share this freq with a very active TCP/IP gateway, so we are trying to get 145.79 coordinated as a permanent home. There are a number of RELAYS on both .15 and .05, so if you get with about 50 miles of SLC, you should start seeing the fixed station posits.

We have two standalone trackers who operate in the area, N7Y0Q and KB7DD who is just getting his mobile operational.

KB7DD and I have been working on a semi-permanent GATE to 30m (some of you may have seen it this weekend), and are making good progress.

If you hit the right week, KF7TA is a wide area digi on Farnsworth Peak at 9500 feet on 5.15. Dan is a transmitter engineer for a local tv station and does a week long sting up on the mountain every other week. We expect that to be our permanent WIDE location as soon as we get the equipment rounded up.

I guess I'm the closest thing to the APRS coordinator in SLC, although not officially empowered!

Bon Voyage!

At the Ham Radio Roundup yesterday at Missile Park, San Diego, Channel 10 TV news came out to film the event and they were very impressed by APRS and did a quick newspot on it. There was an excellent close up of the APRS screen

showing the San Diego map by Dave WH6YC! Many "APRS" signs were visible in the background. About 8 mobiles with the Trimble GPSs came and their trips to the Roundup were shown on the screen. There has been great interest in the Trimble Mushroom GPSs and I'm not sure how many are left. Chuck WB6IGP is the source. Sorry, don't have his phone number but he is OK in the Callbook. Chuck writes the column about Microwaves for 73 Magazine "Above and Beyond". Several Hundred Hams were in attendance to the Roundup and I gave out almost 50 copies of the APRS73D and the new CaMaps, so we should see a further explosion in APRS Activity soon! Also impressed by APRS was Assemblywoman Denise Duscheny, who was told of all it's emergency uses. We showed her a portable GPS/TNC/HT unit that could be backpacked to rescue sites. APRS was truly the highlight of this big HAM event and everyone had a great time. Special Thanks to SBRU (South Bay Repeater Users) club for the APRS Demo and the great WIDE on Mt Otay. 73

Gerry,

Beta unit's are limited to a quantity of 10 because of the cost. In low volume these unit's are worth about \$800 each, and are given to people who have had or will have a direct impact or influence in the design of the DFjr. In appreciation, they will get to keep the units with the latest software, of course.

Thanks for the interest.

APR COMMENT: APRS was not designed to parse all possible garbage on frequency. If you monitor a BUSY, NON APRS channel, expect crashes, as APRS tries to pull out POSIT data from packets. I could check every possible character and value, but that would significantly SLOW DOWN APRS.. TO SOLVE THIS PROBLEM ON A SHARED CHANNEL, use the BUD LIST in your TNC to filter out all packets from BBS's and NODES...

> Fire up APRS. Alt-S/Modes/DxClustr, space_bar to draw the map, then let

APR REPLY: MONITORING A RANDOM CHANNEL IN DX MODE IS PROBABLY LESS VALUABLE THAN NORMAL MODE. DX MODE IS ONLY LOOKING FOR DX CLUSTER FORMATS

Rendered body type: text/plain

```

Now that the PICO-TNC from PacComm supports 4 aliases, we need to figure
out how to use these intelligently. Here is a suggestion for a LINEAR
string of digis, so that packets go out BOTH directions 4 hops without
DUPES. This is only an example, and should be considered as an academic
chanllenge for those of you with network topology knowledge. Each of
these columns represents a DIGIPEATER and its 4 aliases (single letters
for now, and W and R = WIDE and RELAY). I put dots in the far away digi
aliases, so you could better see the propogation of the R,W,A,4 path to
the left and the R,W,B,3 to the right... SOmeone needs to figure this
out for 2 dimensions...

DIGIS:

ALIAS 4:	.	.	.	4	5	6	1	2	3	4	5	6	1	2	3
ALIAS 3:	.	.	.	.	A	B	C	D	A	B	C	D	A	B	.
ALIAS 2:	.	.	.	.	.	W	W	W	W	W	W	W	W	.	.
ALIAS 1:	.	.	.	.	.	.	R	R	R	R	R	R	.	.	.

UNPROTO PATHS:

unproto paths used by users in	R	R	R	R	R	R
the vicinity of each of these	W	W	W	W	W	W
digis so that packets go	A	B	C	D	A	B
out symetrically in both	4	5	6	1	2	3
directions.						

PROBLEMS:

- 1) How do you figure out symetrical patterns in 2 dimensions?
- 2) It doesnt help mobiles beyond the current R,W,W since the
input path is different at each digipeater...
- 3) With the current ALT-PATH capability in 73d and later, maybe forcing
symetry is NOT necessary.
- 4) Currently you put WIDE-RELAY in your BText... Is there room for 4?
- 5) This could get out of hand!

OK, Jack Cavanaugh has now released his MAKE-MAPS-HUNDRED-K program called MKMAPHK1.EXE. I have just posted it on TAPR.. as mkmaphk1.zip.

This zip file contains MKMAPHK1.EXE, BAS and TXT
plus a few sample maps of virginia that he made....

This program will allow you to build street level maps of anywhere in the USA from the USGS CD-ROM (11 different ROMS cover the USA).. Or probably from the INTERNET versions of the 100K maps that are available. Dan Reilly, W4NMK, in Black Mountain will probably tell us what we need to do use INTERNET files as input files for this program.

HOPEFULLY THIS IS A LESS PAINFUL METHOD. ALL YOU DO IS:

- 1) get the raw USGS files into a working directory on your HARD disk
- 2) Tell MKMAPHK1 the LAT/LON of the map center and the map size...
- 3) Come back in an hour (or less depending on your PC) and see what you got...
- 4) If it is a mess, do it again with a smaller map radius...

DISCLAIMER: I have NOT tried this, but his maps DO WORK... Do NOT ask me how to do it, hi hi, READ MKMAPHK1.TXT. and MAPS-CD.txt for some of the history that got us to this point. (MAPS-CD.txt does not yet know about this MKMAPHK yet)

Using this program, I estimate that over 50,000 maps would need to be generated to cover the USA at street level detail... IF YOU NEED EM'FOR YOUR AREA, NOW YOU CAN DO EM!

I think someone who gets good at this should figure out the value of his time, and offer to make detail maps for those willing to pay... And JACK KB4XF Cavanaugh deserves a LOT of support. I asked if he wanted to make it SHAREWARE, but he did not want to be bothered with the envelopes. Lets see how valuable this tool is, and then decide how to compensate Jack for his 6 months of programming effort.....

PS, as soon as I finish this message, I will also post MKMAPHK1.ZIP on the ARN BBS 410 280-2503 for those who do not have FTP access...

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

> (for equalization). I've tried putting TONE 3 in the INITAEA.TNC
> file, without result.

APR REPLY: As you can see, there is no TONE command in the INITAEA.TNC file... so obviously some other command is being interpreted by your PK-88 as a TONE command. Look through the list of commands carefully and see if any of them cause the TONE command to change?

Such is the frustration of INITIALIZING TNC's when the manufacturers all use different comands... If you figure this out, lemme know...

Well made a couple of street level maps using Jack KB4XF's new software and although there are a few bugs in it, it's almost as easy to make a street level map with this as with the 32 mile maps. Using a fast machine i whipped out a map of downtown Huntsville inside of 15 minutes. Like i say there are some bugs in the program. If you attempt to make the map to large it gave me an error and threw me back to dos. But in anycase if you have the CD-Rom there's no reason you won't be able to whip out those great street level maps. It's still hard to get them down to 3000 points tough Hi Bob. Sure wished that could be raised to at least 4000 points because it always seams like that's what it always comes out to hi. Anyway i want to say to Jack although he's not on internet (Great Job).

497. mkmaphk1 and internet-derived DLG files

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Mon, 30 Oct 1995 16:40:56 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <Pine.3.89.9510301647.A17001-0100000@solar>
Rendered body type: text/plain

I've played with the files in question for a couple of hours this afternoon. I'll be posting UNBLOCK.ZIP to ftp.tapr.org later this evening. Using the unblock.bas program makes the files work appropriately.

1. Go find gzip on the internet somewhere. I will endeavor to place a copy of THAT out later on, if I can retrace it. It's needed to

uncompress the files from USGS.

2. FTP to edcftp.cr.usgs.gov (or go to <http://edcwww.cr.usgs.gov>) and grab the appropriate DLGs you need. Use the information in mkmaphk1.txt (distributed with the .zip Bob already put out) to determine which and how many files you'll need. This is significant, or you'll end up with hole sin your map.

3. Download the appropriate files in binary mode. Note that you WILL have to change the names when you download them. They're usually well past the 8+3 dos convention.

4. Use gzip to unCOMPRESS the files from the .gz format. That will leave the files in the form filename. with no .ext... In other words, the .gz file is history.

5. Use the quickbasic program unblock.bas to modify the file from free-form to 80 character per record blocked format. UNBLOCK will append an extension of .DLG to the filename to let you know it did its job, and it will place the blocked output file back in the source directory (where the raw DLG came from) preserving the filename as it was.

*** I use a directory off the APRS subdirectory called USGS where I download everything from the USGS, and where I place processed files. I periodically offload it to tape, since I really don't want to wait for FTP service on THIS network. I have a directory (\aprs\DLG) called DLG off the \aprs directory where I place the blocked DLGs for porcessing by MAPFIXxx and MKMAPHK1. I do a copy (copy \aprs\usgs*.dlg \aprs\DLG*) to get the files over there. At this point, mkmaphk1 operation is per the existing docs.

I then ran mkmaphk1 and fully qualified the pathname, although it didn't appear to really need that.

I have been REAL happy with the result so far. I've got a few more maps to generate and then we'll see how it all correlates with DGPS-corrected tracks here.

It might be worth checking the version of the software for these units. When I got my GPS-45 about three months ago, I saw units with several different software versions. I picked the latest one I could find, version 2.40.

Software version is shown on the login and logout screens, but you have to look quickly - the screens don't stay there long.

This would also be useful idea for exits and other features you might only want sometimes. These are the 'overlays' I have mentioned several times. It would be nice to be able to do it with map data as well as just point (station) data.

> 2) I pre-loaded several messages to MSG so that I could reply to
> incoming messages using the F2 REPLY command and the new feature where
> using a single numeral key for a message, will copy one of the existing

This could have been done with QuickKeys if I'd thought of it. But I wasn't expecting to talk to anyone on a weekday trip (I plan another to LI tomorrow).

> 3) I preloaded WIDE,WIDE and RELAY,WIDE,WIDE paths under the path names
> of WW and RW so that I could rapidly re-configure my unproto path using
> O-D-WW or O-D-RW depending what kind of WIDE digi I was near...

This would have been nice. Let me just say that there appears to be none (or certainly few) WIDES along the route I took (395-290-495-93). I very rarely heard anything (was listening to audio) and rarer still saw anything on the map. There did appear to be a BARC station which didn't seem to have a wide alias as it didn't digipeat my transmissions.

> 4) THE APRS DISPLAY was adjusted so that it was CLEARLY visibile from
> the back seat. KIDS (ages 6 and 8) checked the display frequently, and
> instead of asking. "ARE WE THERE YET?" or "HOW LONG IS IT NOW DADDY?",
> they would only ask "Show ATLANTA" or "SHOW US WASHINGTON".

I was pondering on that, not that I was worried about kids (who weren't with me). I think I will be constructing a platform to mount on the front seat to hold the laptop a little higher (and more secure from sudden stops/turns). I will also be constructing a 'curtain' to block out the sunlight, something across the dashboard back to the headrest with enough gap that I can peer under at the screen (the screen seems to be sensitive to light, it changes contrast depending on sunlight on matrix).

> 5) Since there was only ONE digi we found in 600 miles from DC to

 > re-center the map on your CAR...

I think I would like something like this on the Mac as well. It would be nice for such occasions to have the ability to do manipulations without fiddling with the mouse/keys. It was EXTREMELY difficult to manipulate the map (ie zoom) because it requires both a mouse action and a key press (option click/drag)! It would be nice to move it with arrows and zoom a set amount via a keypress. It would also be nice to either (a) have an option for constant centering on your position (which is presumably moving) or (b) have a command (ie keypress) for centering the map to your current position. Also it would be nice if those menu commands for zooming/unzooming worked (then I could setup a QuickKey for them). And while I'm at it, it would be nice to be able to switch more easily from one map to another when you go off the edge ... perhaps a command to seek out the smallest scale map you will fit within.

Just some ideas. I will tell more after my trip from Norwich CT to Valley Stream NY tomorrow.

Well here is my 2 cents worth as far as activity farther to the south from Atlanta which Bob recently did. After my live APRS trip to NJ frm FL and back in September the only activity I saw south of Atlanta was a little bit in Jacksonville FL. No digi's popped up in the area but I am told that there is one serving Jacksonville since late August or so. A few stations did pop up but coverage to a 50W mobile with a mag mount (rental car) was almost ZERO. Farther South nothing was picked until I reached the Melbourne area (little farther South than that) and from there on in the APRS corridor was reached. Coverage continues to the Southernmost tip of the USA with some dead spots here and there for mobiles but probably 100% coverage for home stations in the populated areas along the coast, not much reason to give the Gators APRS coverage. Let's see, we now have GPS trackers on cows, anyone game to strap a waterproof version on the back of a Gator ???

It seems that most of the WIDE digi's have landed along I-95 and the FL Tpk since most of our populated areas are right next to these two intestates, we have been lucky. Digi's are located in Ft. Pierce, West Palm Beach, Boca Raton, Hollywood, Miami, Homestead, Marathon Key, and Big Pine/Key West. Seems that activity is picking up in the Orlando area and Daytona Beach is not too far behind, now the job of linking them to us to the South on VHF/UHF will be the big job! If digi's come up the the Daytona area in time for Bike Week in March of 96' I will consider taking a tracker along with me on the Harley. I have been told that a GATEWAY is somewhat in operation in that area so that may be interesting to post on HF for my 3-4 day stay.

I totally agree with the others and so does the Wife N2RHU we need more digi's or at least active stations along the intestates to make APRS worthwhile to drag

along on a long trip. The NJ-FL trip was VERY boring till we got to VA/MD or shall I say MD. VA APRS was very weak, even when we were in 2M Voice range of the Annapolis area repeaters. Entering in DE APRS was useable but weak again with packets along the NJ TPK here and there till we reached the Woodbridge area where the BROOKLYN NY!! digi picked us up and gave us positions from the rest of the state, MD/VA and CT. Boy when there is coverage it is great but at other times it is almost ZERO.

Would be good to have one other representative from all the other areas to fill us in on their network range on the sig.

Ap> change?

EUREKA STEVE! Thanks to your message, I've finally found out why I've had so much trouble in getting my outgoing packets to be heard by the rest of my local APRS network!!!

Bob, I am also using a PK-88 TNC and just verified that APRS (73d) is indeed changing the TONE parameter to 2. It MUST be at three for proper tones to go out at the right levels.

No other commands in my INITAEA.TNC are causing this. I verified this by eliminating all commands entirely from the file: Still occurs!

It HAS to be coming from APRS at some point. Oh, and I've confirmed that modifying INITAEA.TNC with a TONE 3 command has no effect.

Going into OPS-COMM-TNC and setting the TONE to 3 that way seems to correct the matter temporarily.

However, initializing the TNC from within APRS sets TONE back to 2.

Ap> Such is the frustration of INITIALIZING TNC's when the manufacturers
Ap> all use different commands...

Tell me about it! But it seems to be something else going on here underneath the "visible" configuration commands, Bob.

Regards,
Joe

Internet: joe.garber@logon-philly.com
Amateur Radio Packet Network: WB3IHY @ KE3CZ.#EPA.PA.USA.NOAM

P.S.: FOUND PART OF THE ANSWER! The command that is being sent is VHF ON or a subset of that command string. It is, as far as I can tell, UNDOCUMENTED in the PK-88 command set, but since the PK-88 commands are a subset of the PK-232's, it is probably a leftover of some sort.

In any case, when VHF is sent to a PK-88, it causes the TONE parameter to be set to 2, even if VHF has no parameters following it!

It is NOT coming from any of the "visible" TNC configuration files that can be modified from DOS.

Hi my name is Aaron Elekes VE6FXR. I like your APRS software, and would like to register it. I am writing just to make sure that the price is still the same at \$24.00 US and \$14.00 US for the extras.

I have also heard that there is an APRS message (NEWS) area somewhere on the net. I would also like to subscribe to that, if you know what the address is?

I would like to keep in touch as I have GPS, APRS, Doppler and my laptop ready to go. All I need to do is register so I can try this out.

Thanks 73's

Actually, heat. LCDs respond to thermal changes (remember the cute little thermometers you slapped
onthe kids' foreheads about 10 years ago?) but sunlight has enough energy to translate to heat easily!

507. PK-88 and TONE command

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 31 Oct 1995 09:39:46 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951031093441.17924B-100000@greatlakes>

Rendered body type: text/plain

Several users have reported that their PK-88 will not work with APRS, because during the init sequence, APRS turns their TONE command to the value of 2 when it should be 3.

APRS only sends two commands that are NOT in the INITAEA.TNC file. They are Hbaud and VHF. Apparently the VHF command is causing the PK-88 to shift the TONE parameter from 3 to 2.

Until this is resolved, you will have to use O-C-T to manually change your PK-88 tone command to 3. Is there anyone out there with a PK-88 that DOES NOT change its TONE from 2 to 3 when you give it the VHF command???

If so, what version of Pk-88 ROM are you using that does NOT experience this problem?

509. REGIONAL plan for 4 Aliases

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 31 Oct 1995 10:13:55 -0500 (EST)
To: aprssid@tapr.org
Message-ID: <Pine.SUN.3.91.951031095702.17924D-100000@greatlakes>
Rendered body type: text/plain

I submitted a proposal for using 4 aliases at digipeaters which had the advantage of symmetry in a linear system. Meaning at any single DIGI, you could choose a path which would go out 4 HOPS in BOTH directions, WITHOUT DUPES, covering a total of 7 digis. Lets call mine the LINEAR SYMMETRICAL plan.

John Moyers suggests another approach to 4 aliases. Lets call his the REGIONAL APPROACH:

>
> S = State
> R = Relay
> W = Wide
> G = reGional
> C = Callsign
>
> By beaconing S,R,W ANYBODY FOREIGN to an area could get out 4 digi's
> with Minimum dupes. You can target any area by using any of these:
> C,G,W,G
> C,C,S,G
> R,G,W,W
> C,S,W,G

> C,S,S,L

APR REPLY: This plan solves the problem of not knowing what digipeater CALL signs to use to hit an area, but I see disadvantages:

- 1) It is no different than using C,C,C,C which we do now, except that you dont have to know the exact call. But with APRS, you always know the calls by just looking at the map..
- 2) It only goes in one direction.

CONCLUSION: Unless I'm missing something, Its neat, but I see no real advantage. Sorry John... hi hi

Ok, either there's a bug, or I'm doing something wrong...
My alias is RELAY.
My Digi Path is WA9CJN-15,RELAY,RELAY
When I transmit, CJN responds, but then my RELAY xmits. I thot my station was supposed to ignore ALIASes xmitted from my station that are the same as mine. Hence, my station xmits at the 1st RELAY from CJN, and that collides with any other RELAYs out there. Am I doing something wrong?

I'm probably doing something entirely stupid, Bob, but in trying to help one of the fellows here get a pk232 running correctly, I've noticed that switching bands with the o b vhf/hf command string doesn't do two very important things in my pk232 - set VHF and HBAUD correctly. That is, if I'm on vhf and try to go to hf, I have to do o c tnc and manually change VHF to OFF and HBAUD from 1200 to 300 - and vice versa.

Has anyone else seen this? I've also noticed that when you initialize the pk232 from Alt -S, it sets AX25V2L2 to "OFF", meaning it changes to AX25 version 1. Is this correct?

Rendered body type: text/plain

I have just posted the APRSdr.ZIP file in tapr/SIG/aprssi/upload.

It contains APRSdr.exe and DR.txt. I did not preserve the directory so when you UNZIP it, the DR.txt will go into the APRS directory. Be sure to read this new one vice the one that is in version 74 distro.

APRSdr.exe can dead reckon objects along a MARATHON course or any route added to an APRS map in PURPLE. The objects make all the turns and only need to be given a reasonable SPEED to stay on track..

You will need to use your V# to save a CONFIG file under APRSdr before it will do the automatic path following mode. Then it will DR the first object marked for FOLLOWING on the P-LIST. To DR additional OBJECTs, you will also need to enter your DF/DR number...

Dave, I've used a Garmin and a KPC-3 for about a year with NO problems until last month.

I have used the HSP cable on a Tosiba 1100+ and a Zenith Znote. Both worked great.

Last month I "turned" in th Znote and was issued a TI 4000M. The HSP cable did not work. Traced it down to the TI. IT doesnt put out the correct voltage to swing the HSP.

Someone said to open up the TI and feed one of the pins voltage so the HSP would work.... dont want to do that, since I dont want to pay for it...<g>

I think you can get a "new" HSP cable wired a little different, dont know how different...maybe others will chime in.

Kent KQ4KK (with a nice notebook, but no "working" APRS right now)

I too have a similar problem with my MFJ 1278, two port tnc. Maybe the answer is to have a VHF initialize file, as well as a HF file, read in to the TNC at boot up or when you do a band change command. That way the correct radio port as well as other parameters that have to be set, would be sent to the tnc. It would save having to go to the O-C-Tnc screen to change it... Keith N4ZQ

Ahh the same problem crops up again.

If it is a PACCOMM HSP cable, the cable is looking for power (around 6-12 volts or so) on PIN 6 of the laptop. Later cables had an orange wire connecting that PIN 6 to the one on the TNC plug. Fine, as long as the TNC has power there. Paccomm could not anticipate every laptop's different requirement.

I have "fixed" several of these for people. Here's how.

Use your meter and probe for voltage between pin 6 on the laptop's 9 pin connector and its ground pin (sorry- I can't remember the pin # for ground). Dollars to donuts, there is no voltage. Most thinkpads and compaq's and even the Winbook have this problem.

Look for power on pin 6 of the TNC's 9 pin connector. Same thing.

Now find some power on either device. The winbook had power on pin 7. DO NOT use power that may be seen on the TX or RX data lines.

On a Kantronics KPC 3, you can put a jumper inside and run power out on pin 25.

Anyway, once you find power, connect it to the part of the circuit that is currently connected to pin 6 of the laptop connector. You will probably want to detach the connection going towards the laptop (might not want to feed power in there)

If all else fails, a 9 volt battery will work, or possibly even 12 volts from somewhere (fused of course)

The object is just to power that transistor circuit that is currently to pin 6 for its source.

Of course: If you fry something, I take no responsibility.

522. Help with APRS and WIN95 pse..

From: n2czf@gate.net
Date: Tue, 31 Oct 1995 19:14:20 -0500
To: aprssig@tapr.org
Message-ID: <199511010014.TAA40809@tequesta.gate.net>
Rendered body type: text/plain

I have just upgraded to WIN95 here and am just starting to get the hang of it. The only benefit I have had so far is the hardware wizzard, it solved my commport and IRQ problems that I had on 3.1 with a serial mouse, internal modem and a 25pin serial port for the TNC. Now that I can run anything from here without needing to disable one of the devices I need some windows help from the more experienced 95' users. Currently APRS 7.3a runs in a full window without too much trouble. I did wake up this AM with a strange CONTINUOUS "BEEP" on the sidetone speaker, APRS did not crash but it did halt until I hit a key, then the tone ceased and everything was fine. A little later the tone appeared again and I let it scream for a while and then it stopped on it's own, APRS was still stopped but no tone. Hitting a key resumed normal program operations. I have not zeroed in on the cause yet, has anyone else??

Now excuse me but I am still 95' illiterate, how can I setup APRS (or any DOS pgm) in a window so I can switch between applications. It will probably be a few days till I get to the bookstore for a good 95' book. P.S. the book that comes with the upgrade for new PC's really STINKS!

I am not having much luck getting MKMAPHK1.EXE to work with the 100K USGS DLG files. When I run it I get the error:

Bad file name in No line number in module MKMAPHK1 at address 12CE:12B9

I FTP'd the files from the USGS, gunzip'ed them, unpacked them and made sure I only had *.dlg files in the directory. MKMAPHK1 runs for a while and is drawing on the screen when I get the above error.

I've tried the following:

- running in DOS, not a DOS window in Windows 3.1
- booting with a min. configuration (no drivers, no TSR, etc.)
- using different map radii (8.4, 2.1, 1.05)
- making sure the radius was entirely within the DLG data

I'm using the VANCOUVER, WA West data with a map center of 45,32.0 lat./122,50.0 long., and 2.1 nautical mile radius if anyone wants to reproduce my problem.

I can't use MKMAPHK1.BAS since I only have the qbasic that comes with DOS and can't use the /ah switch.

APR REPLY: APRS unzips to about 3 megs I guess when you include the MAP files for your region. Tonight I just finished APRSmin.exe which is a minimum version. It is 316K compared to 373K for APRS74.exe. This plus DOS only uses 495K on my PC versus the 553K needed for 74. I donno if this makes much difference, but at least you can now use a 360K floppy to transfer it if needed.

APR REPLY: Of course it depends on your area. It is ONLY a good idea if your WIDE digis also have the RELAY alias and if that particular mobile normally travels outside of the area where he can hit a WIDE directly. Such as in my case, my 1 watt tracker cannot be heard by the WIDE, but my home base station (RELAY) can hear me when I am near home. Then as I get closer to work, where the WIDE is, it begins to hear me.

In the long run, WIDES should be WIDELY separated, so by definition, there should be weak areas where mobiles typically cannot get in. That's where using RELAY, WIDE helps.

If your area has WIDES everywhere for mobiles, then THERE ARE TOO MANY WIDES in that area, hi hi...

For some silly reason, it worked great for me today when I made a map of Sandwich IL. I just used gzip -d, put it (the AR2_rdf file and the UNBLOCK.BAS...thanks!) in their own dir, and followed the directions. Much to my amazement, the program spit out a street level map! The biggest trouble I'm having is downloading the files from the server, and deciphering which USGS 100k map covers the area that I want. I'm very

tempted to get the CD-ROM.

Thanks guys, it works great!!!!

I see some questions as to the new 100,000 program giving error. Well i have made 18 maps today and have found several bug in the program, several even locked up my computer, but all in all he did a great job of writing the software. You have to be carefull on how large a range your using. Most of the heavy populated areas can only be done with +.8 to maybe +1 I have found after using it all day that once you get use to the program the errors are able to be worked around. I timed myself and it took me 15 minutes to make 3 one nmile highly detailed maps of Birmingham Alabama. The most time saving of the whole process is you can use the files directly as they come of the CD-Rom without first having to unzip them. Of course thos actually downloading the files from USGS will spend lots of time D/Ling them. I have found that most of the time i cannot even access the files, don't know if they are down sometimes or what!. All in all it's fun making those street level maps now. I still wished that Bob would tell me how to shut off that darn beeping when trimming some maps in mapfix16.exe it's waking the XYL all the time. O and MAKE SURE you read the docs.

So, if you have net\$cape, Mosaic or a Web Explorer of some kind, go to
<http://edcwww.cr.usgs.gov>, look for the 1:100,000 DLG stuff under Data
Products, and download via graphics. Piece o' cake!

or, become a bithead like me and memorize teh Green Catalog and go directly to
the directory you want...:-)

Methinks Bill doth protest too much.

the USGS server appears to be using their own CDRoms. That's an inherently
slow medium, and if they're using a jukebox arrangement, access of the CD
takes a while. I suspect, based on prformance an a couple of notes on the
web, that this is the case.

Now that APRS74 is my new baseline, I have posted two additional EXE files.

APRSdr.EXE which has the PATH-FOLLOWING-DEAD-RECKONING mode in it.
APRSmin.EXE which is a minimum 316K version vice the nominal 373K for 7.4.

In both, I removed all DX, WX and DF functions.

If for some reason you just gotta have APRSmin a few K smaller, then I
may be able to find 1K or so (with a lot of work). Anything beyond that
and you will start losing basic functions... If APRSmin DOES solve some
kinda size problems for you, lemme know. Otherwise, I dont see how the
20% size reduction really helps much...

Just thought the SIG might enjoy this one:

----- Forwarded message -----

From: CDR xxxxx (name removed since this was an internal memo)
Subject: OCEANOGRAPHY CLUB NOON TALK

**ATTENTION ATTENTION ATTENTION **

Do you know what a "DATUM" is? Do you know that your ship could run
aground if you relied solely on GPS to navigate in coastal waters? Did
you know that two bombers from two different service branches could
drop bombs on a different location although they used the same
latitude and longitude? Did you know that forward observing Marines have
received "friendly fire" because they called for Naval Gun Fire Support

based on charts different from the ones used by the ship? All this and more will be explained at the OCEANOGRAPHY CLUB NOON TALK on 8 Nov in Mich 117.

LCDR Reese from the Defense Mapping School will give a talk at 1200 8 Nov on the important topic of Charting and Mapping. He brings with him some very current lessons being learned in Bosnia. This is topic of interest to all fleet operators.

----- end of forwarding-----

This shows why I dont really get too excited about APRS maps at the 100K scale when my radio range is 30 miles... hi hi

Rich,

I've also upgraded to WIN 95.

And, yep, if you leave APRS running in WIN 95, mine also used to lock up and a continuous BEEP.

What was happening was WIN 95 was doing "housekeeping" work while it thought the PC was idle. I had to disable the "scheduled housekeeping" while I run APRS (or any other LONG running program in DOS).

Since Im at work, I do not remember the exact name of how to disable. But I got WIN 95+ and it added a very small icon in the lower right of the desktop, that when I right button click, I can choose to disable the scheduled work. I just disable when I run APRS or CT.

I think when you install WIN 95 it asked if you want to do scheduled work automatically. You can go in and change the schedule and what it does.

I have just upgraded to WIN95 here and am just starting to get the hang of it. The only benifit I have had so far is the hardware wizzard, it solved my commport and IRQ problems that I had on 3.1 with a serial mouse, internal modem and a 25pin serial port for the TNC. Now that I can run anything from here without needing to disable one of the devices I need some windows help from the more expirienced 95' users. Currently APRS 7.3a runs in a full window without too much trouble. I did wake up this AM

with a strange CONTINIOUS "BEEP" on the sidetone speaker, APRS did not crash but

it did halt untill I hit a key, then the tone ceased and everything was fine. A little later the tone appeared again and I let it scream for a while and then it

stopped on it's own, APRS was still stopped but no tone. Hitting a key resumed normal program operations. I have not zeroed in on the cause yet, has anyone else??

Now excuse me but I am still 95' illeterate, how can I setup APRS (or any DOS pgm) in a window so I can switch between appplications. It will probably be a few days till I get to the bookstore for a good 95' book. P.S. the book that comes with the upgrade for new PC's really STINKS!

Hello everyone:

Does anyone know if the only way to see .DXF .DGN and .DWG files maps in the APRS is using the plt2map software by jim krist (kg8ge) or there are any other software way to see them??.

I have tried some programs but none of them are able to convert the autocad and dxf files in the .map files the work with aprs.

I know that aprs read the usgs cd-rom with mapfix, but what kind of files are used in this cd-rom, are .dgn??

Please help me, thank you in advance

APRS correctly sets VHF and HBAUD upon starting up a PK232 if you are running VHF. However to run HF you must O C T and set VHF OFF and HBAUD 300. Of course you must do the reverse procedure when switching from HF to VHF.

It's a simple procedure; takes but a few seconds. I've never found it to be a problem.

The MacMapMaker program (Discussed here in the past) which is finally working, will eventually be able to handle some of the obscure formats that you mention. At the moment, it does not do this, but I am rapidly gathering information on these formats so that I can handle them.. All maps made by MacMapMaker will work with both the Macintosh and Windows versions of APRS.

I can understand your point. I must say, however, that I was extremely disappointed that on a trip from Norwich CT to Salem NH AND from Norwich CT to Valley Stream (Long Island) NY I encountered very little support via WIDES. There were NO cases where my signal was echoed back to the north and only two areas (New Haven and Northwestern Long Island) to the south where it was. That means that I have no idea if my signal was heard anywhere but those two areas cover a small segment of the distance between Salem NH and New York City (and of course in New London County which covered about 60 miles of that area). This was a HUGH disappointment ...

Hi Bill...and to the SIG!

Dennis here...just South of Birmingham (Pelham, Al)...I am new to APRS,
and read with great interest about Bill's work with the new map software
on Birmingham. I wonder if I might get those maps for the Birmingham
folks? BTW, I saw your (Bill's) map of Alabaster, Al!

I run the ham bbs here in B'ham (WireNET - 205-444-WNET), and there has
been an upsurge in interest in APRS in the last 4 weeks. I could make
the Birmingham maps available to all B'ham users. (Some, maybe most,
don't have ftp access, and we keep APRS software available for
them)..The WireNET BBS also echos the APRS SIG, allowing any of the
over 350 users to follow the SIG.

FYI, I plan to install an APRS 145.79 digi on the roof of a 175'
building at the top of Red Mountain (ele approx 1050') this Saturday. It
is located in the middle of the city, about 200 feet West of where I-65
passes over Red Mountain.

73,

Dennis - N4NR

I'll be in Indiana (Indy and Lafayette) this Saturday through next Wednesday.
Any APRS going on there? Freq, Callsigns, Digis, meetings? Any local MAPS?
Anybody wanna get together I'll have my ammo-box tracker with me on the
rental car.

Until his provider figures out how Internet addressing works, you may
translate his address
as follows:

wnolle@intercomm.net

What's with the providers in Huntsville anyway? Bill has tried 3 of them
now (that I know of)

Hi Rich;

To get aprs into a window in 95 just hold down the
alternate key and hit return or enter and it will go
into a window. The only thing is the program doesn't
respond then. If you hit the F10 (D0Z) key a window appears
with the words --Screen is dozing-- in it but nothing
else. I am waiting for the windows version to come out.
Using the alt-enter key works for a lot of DOS programs
and they keep on running in the window. I use it for
Quick Track and it runs fine.

Bob, thanks. this indicates that TAPR's box is in fact in error. it
should have looked at the address and parsed it, and enqueued it for
re-mail. It's a sloppy way to get mail around, but in years past, I
have sent many a note via "!! routing."

Bill, Bob is right, though. Your Reply to: address needs help. Check

with your tech support folks and your life will be easier!

18. Clarification on Pico Packet cable

From: gphowell@soulcage.inmind.com (Geep Howell)
Date: Wed, 01 Nov 95 22:44:50 EST
To: aprssig@tapr.org
Message-ID: <199511020322.WAA11514@crucible.inmind.com>
Rendered body type: text/plain

I posted a comment to the net concerning what I thought was a bad cable that was supplied by PacComm with the Pico Packet. They told my friend who bought the new TNC that they would replace the defective part immediately, and were as good as their word, the replacement arrived two days later. However, it was NOT the 6 pin RJ 45 cable that I reported was bad, rather the RJ-45 to DB9 adapter was miswired. The new one placed on the end of the supplied cable worked perfectly. Great service, guys

The BEEPING is the BEEPS in APRS.. Need to shut them off...

To configure a DOS Window, goto Windows Explorer, find APRS7x.exe and click the right button.. Then, under Property, move to the screen tab and select "Full Screen". Under MISC. slide the Idle Sensitivity down to the lowest setting.

This is all I have done.. I made a short cut for APRS74.EXE on my desktop and added it to my START group in case of power failure..

Only thing that doesn't work is the BEEPS. else works great!!

Hope I am some help.. (I'm not very good at it either but I get along.)

Question! I recently finished an APRS/GPS trip from Prescott,Ariz. to my Qth in Tn. I was on 30 meters. at the beginning in Ariz. I had my unproto set to digi thru a loud station on the east coast. Later when I was ready to shut down for lunch I noticed a msg for me from someone on freq. that " I should not be digiing on HF mobile as it was cutting the channel time in half"??? I thought that was what the digi was for, especially when one was mobile. Was I wrong in setting my unproto to digipeat theu another station for awhile?

Jim.

I received a West Marine Catalogue in the mail yesterday, and it had a weather station that looked like the Ultimeter for a \$179 US\$.

They call it a Weather Base and wonder if it is the cheapest price for a weather station I can use for APRS.

Feedback appreciated.

I have a set of maps for Indiana, but they only have detail for Bloomington at this time. I would upload them, if someone would tell me how. Anonymous logins apparently do not have write permission to the upload directory (?). As far as I know there is no Map coordinator for Indiana.

As soon as I can get more data from the server, I'll put together something for Lafayette. Indy will take some work.

I also have been working hard bulding maps. I now have 59 to cover many towns in Alabama. Well actually 2 of the maps are for Nashville,TN. I have a MAPLIST.ALA. I also am in the dark on how to make these available for other users!. 90% of the maps are street level maps done from the CD-Rom. I have uploaded some of the maps to WNET BBS in Birmingham but that's a LD call for me.

APR REPLY: Too bad, Ignore the un-thinking. You were doing the ONE thing that APRS was designed to do. On a LONG trip, I certainly would digi through another STRONG HF station so that I could be tracked by other relatively nearby stations in your skip-zone.

Similarly, mobiles driving 10 miles to and from work daily, and GATING and/or DIGIpeating their posits all over the US deserve to be chided.

APRS ONLY works with the ULTIMETER. Call Peet Bros, and see if that is one of theirs under a different name. The price sounds right for an Ultimeter-II which is also \$179.

I believe the MacAPRS also works with a DAVIS instrument...

My suggestion is to send them by snail mail to KB8JXO, the map-maker-extroidenaire for Ohio. He seems to be spiling over into neighboring states, and he might already be doing maps for INDIANA...

Now that MKMAPHK1.EXE makes it esy to make maps, we need to be getting serious about putting together STATE MAP bundles as described in MAPS.TXT. THat way, the maps are organized in to their proper heirarchy in consideration of the "big picture"...

APR REPLY:

For those without FTP access, put together your XXmapsNN.ZIP file in accordance with the directions in MAPS.TXT and SNAILMAIL them to me on a disk. I will post them if you like. It only costs 32 cents...

Please build the ZIP file exactly as described in MAPS.TXT so that they UNZIP properly using the PKUNZIP -D option...

The message below I think came from Bob WA4APR.

Somehow my cc:mail server or something strips off who is sending the reflector messages from aprssig. So I do not in most cases know who is sending the mail, unless they put their name and such at the bottom of their message.

Is there some way to fix it at MY end?

thanks

DXF is a drawing Exchange File. It's a generic format to exchange drawing files (without decent databases) between different packages, like Intergraph's Microstation, Autocad, ARCInfo, etc.

DGN files are Intergraph (Microstation) DesiGN files. They are *not* directly compatible.

If I recall correctly, DWGs are Microstation drawing files. They might be amenable to translation directly. I'm not sure. I think, offhand, the best way to proceed would be to translate DXFs to APRS maps, or to accept something

else, like Microstation outputs, in APRS...

I will not have time for a while to do so, but can (later) check on .DGN file formats if Keith needs that information down the pike!

Might I suggest using the AMSAT remailer service if you intend to be changing providers and want only to have to change your address once?

I believe their address is "listserv@amsat.org" for info.

Now back to APRS...

> Is there some way to fix it at MY end?

Kent,

With out a lot more information about your mailer and the provider,
only practical suggestion is try a different mailer...

I do agree with your comment, Folks should put their NAME and CALL (!!!) at
the end of messages, it is just common sense to do so... In this day of the
electronic call book, just their CALL is sufficient. Not all people
receiving these messages have control over how their mail is handled or
misshandled as the case may be...

for example:

>DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

or before a reply comment in a mirrored message:

>APR REPLY: YES, EVERYONE DO THIS!!! (but then dont forget later...)

Bob almost always puts a line at the bottom of his messages so you know it is
him even if he is not anywhere near the Great Lakes ... (but not allways...)

Of course, then there is the other extreme !!!

Dont know if this is a proper place to ask
for help on APRS.
Have a Pk-900 and cant get APRS to receive
or trnasmit. I do a complete TNC reset and
re-initialiaze the TNC and just use the
defaults but no go. Once got it to monitor
VHF but the beacon went out on HF. Would like
to see the prog work one time.
I have a Pentium with WIN95 but run APRS from DOS.
Am also trying APRS73D. Alot of times when APRS screen
comes up, if I try to goto TNC commands, the computer
locks up. Any hints to start me?

Here are the instructions for constructing a mobil "Y" cable for use with a Garmin GPS-45, a KPC-3 and a Laptop:

9 Pin		25 Pin
1	to	8
2	to	3 + Brown Wire from the GPS-45 Power/Data Cable
3	to	2 + White Wire " " " " " " "
4	to	20
5	to	7 + Black Wire " " " " " " "
6	to	6
7	to	4
8	to	5

I didn't get the original post in this thread, but incase it's important, *.DWG files are AutoCAD drawing files (Microstation may also use the same extension, I suppose, but AutoCAD is *definitely* *.DWG)

From: Gerald J Creager [SMTP:gerry@cs.tamu.edu]
Sent: Thursday, November 02, 1995 11:30AM
To: aprssig@tapr.org
Subject: [APRSSIG:4151] Re: help with maps.files

DXF is a drawing Exchange File. It's a generic format to exchange drawing files (without decent databases) between different packages, like Intergraph's Microstation, Autocad, ARCInfo, etc.

DGN files are Intergraph (Microstation) DesiGN files. They are *not* directly compatible.

If I recall correctly, DWGs are Microstation drawing files. They might be amenable to translation directly. I'm not sure. I think, offhand, the best way to proceed would be to translate DXFs to APRS maps, or to accept something else, like Microstation outputs, in APRS...

I will not have time for a while to do so, but can (later) check on .DGN file formats if Keith needs that information down the pike!

Rendered body type: text/plain

Hi....

I thought that I had read that the mouse feature only worked for the Microsoft Mouse....Well, I was surprised to find out that when I moved my LogiTech Trackball, it moved the cursor across the screen... It was quite a change to quickly move around the APRS screen with the trackball rather than using the arrow keys to change positions. I am using APRS 74.

I have noticed two things in the last few revisions that I have not run into before. Cant figure out why all of a sudden that these two differences are starting to appear.

1) After transmitting the regular position updates, I have begun getting the statement that - APRS does not see current position - or something like that. This statement appears after every transmission even though the station that I digipeat through transmits my position and I see it returned.

2) When sending a message (one liner) to another station, and receiving an ack 1 from the other station - another message is generated and an additional ack is received....If I make a manual transmission using (X) followed by All....That same message is resent again...

Maybe I missed something and somebody can enlighten me on what I am doing wrong..They dont seem to cause any problems with the operation....

73...Jim

Hello Bob,

I have found by PKLITE'ing a program I can reduce it to about 1/2 the size with no measurable loss of performance.

I wonder if you have tried PKLITE'ing APRS.. I did after I downloaded APRS74 and have been running it bug free since. (Except for whats already there of course - Mouse in DOZ for instance.

Rendered body type: text/plain

Hello Group:

I'm just getting started trying to make maps.....dl'd the maps from usgs via internet.....used gzip -d to decompress.....placed results in a c:\dlg directory.....ran MKMAPHK1.exe.....program says my raw data does not contain my defined lat/lon coordinates.....but it should as I was careful to dl the map for my area.

I double-checked and it seems I'm missing the EXTRACT.exe program which apparently is needed to process the raw, just decompressed, usgs map data. Would someone please confirm whether I need extract.....I will search the usgs ftp site again.....I did find something in the APRS files named USGSMAP1.bas, is that the EXTRACT program in disguise ??

Thanks very much ! 73, Jim K6OYY TAPR 502

I have a few questions, can someone help?

Here is what I use... A Garmin 45, KPC9612, 386 Laptop, and a Kenwood 733A.

1? - When I am driving, is there anyway to erase my callsign at my position while the screen updates? It seems to get very messy after awhile. Once I press the spacebar, it clears up, however I loose where my last track was.

2? - How is it that two of the exact setups on two different stations cannot here each others beacons? One may here the other, but not visa versa?

3? - What is RELAY, RELAY,WIDE, WIDE,WIDE? Which is better to use as a mobile station?

AND the last question,

4? - Has anyone used or have a DOPPLER linked with your GPS/TNC/LAPTOP and done some real DFing????

Thank you to anyone who replys....

oh one more. What are errors 5 and 6 in APRS V7.2 ???

The USGS data obtained from the internet us in a UNIX text format and lacks cr/lf which are needed in pc text files. You need the program unblock from the tapr FTP site to parse the file into 80 character chunks, and then things should work.

47. APRS Maps on CD-ROM

ANNOUNCEMENT

There has been a lot of discussion about APRS maps. We are going to be producing a CD-ROM full of maps for APRS, MacAPRS and WinAPRS (the Windows version of MacAPRS). This CD-ROM will have over 500 megabytes of MAP files. We will have this available at the 1996 Dayton Hamfest. We hope to sell the CD-ROM for about \$20.00.

Mark Sproul

PS

If you have APRS maps that you would like included on CD-ROM, please upload them to TAPR (preferred) or email them to ksproul@noc.rutgers.edu.

You missed my note. Wander off to ftp.tapr.org and in
tapr/SIG/aprssi/upload, look for UNBLOCK.ZIP. Grab it, unzip the
short basic program in there and apply THAT to your unformatted (and
hopefully, OPTIONAL format) files. MKMAPHK1 will be happy then.

APR REPLY: a) do an OPS replay, to restore your track footprints AND/OR
turn calsigns off with the MAPS-FEATURES-CALLS

>

> 2? - How is it that two of the exact setups on two different stations
> cannot hear each others beacons? One may hear the other, but not visa versa?

APR REPLY: If there are 2 stations that hear YOU, and you use RELAY, then
they will BOTH digipeat and a 4th station that also hears BOTH of those
stations will ALWAYS hear a collision. INTELLIGENT choice of PATHS is
the MOST IMPORTANT thing to figure out about APRS. THERE IS NO ONE
ANSWER. You must always make your path appropriate for your position

>

> 3? - What is RELAY, RELAY,WIDE, WIDE,WIDE? Which is better to use
> as a mobile station?

>

APR REPLY: See 2 above. It totally depends on your local area, digis, and
stations near you...

As soon as you make a rule, there are exceptions!
When I said that sending your APRS mobile posits out on VHF every day while you commute was not a good idea,.....

I was NOT thinking about ANYONE in particular, hi hi

In fact, I certainly don't mind seeing those APRS commuters every day in and day out. We have 2 in our area, and I am VERY happy to see them mobile always! That's what APRS was for...

Our local APRS mobile uses several different paths in his TNC so that his posit goes out once every 40 seconds on VHF local, once every few minutes via a few digis, and once every now and then via GATE..

A perfectly NEAT way to do it...

See next message about RELAY,WIDE,WIDE

Rendered body type: text/plain

W7KKE was visiting APRS mobile from CALIF to the DC area, and was amazed how hard it was to be seen going via WIDE (without a few mountain digis)

This was a lesson to me.

We have been pushing the conversion of all WIDE digis to be WIDE-RELAY digipeaters, so that mobiles can use the path of RELAY,WIDE. On our flat earth EAST COAST this is needed so that the mobiles can be seen when they are beyond the range of a WIDE, but are passing near someone's home station. This works WELL..... (here)

Ken pointed out that doing that in CALIF where there are lots of home APRS stations that themselves are on mountains, may NOT be a good idea. If 2 or more home station RELAYS digipeat the packet, then BOTH signals collide at the input to the WIDE, and it never gets digipeated via the WIDE.

The lesson is: Use your head. Don't depend on fixed answers to anything. Topology is what determines VHF communications ranges, and TOPOLOGY is unique to YOUR area. Also the location of RELAYS, and WIDES is UNIQUE to your area. Pre-load several possible paths in your OPS-DIGIS table and change them on the fly as needed as you pass from area to area.... Good luck, hi hi!

Greetings, all. I've been downloading map data for a while now, and noticed yesterday that they were "Down due to Hardware Problems." Today, they are back up, but they seem to have put a new CD in the jukebox (or however they store their data). Now, instead of the 2M data being divided into regions (lower_mississippi_valley, southeastern_states, etc) they are now divided into individual states. Also, data for each layer of features is stored in a .tar.gz. Upon downloading and decompressing

these, I found that the .GRA files are no longer included here. The only files the archive contains are .DDF extended. Is there a way to convert these .DDF files to the .GRA graphic format required by MAPFIX? Or could someone provide me with a conversion method so I can write a program to do this.

One of the readme files said that the .OPT and .STD data would be available on magnetic and optical media 'at cost'. Does this mean it will no longer be available online?

If I've missed something, or just didn't look deep enough, I apologize, but a slight panic mode set in when my data source dried up overnight.

Chris Cannon, KB5YRZ

(Trying to make some good LA maps, but running into walls.)

PS I was getting the data from edcftp.cr.usgs.gov. Are there other sites that still have the .GRA data?

I can see APRS evolving into something not unlike cellular phones, which would be a more automated system of what was described in the CAP Arizona Wing APRS reports for operation. If TNCs can be remotely programmed, I envision that there be master control stations stationed throughout the country, which monitor the activities, "seeing" where the various stations are headed and performing dynamic settings changes to the users so that they get the best coverage on the system. The master control stations can even automatically control traffic in certain areas so as to restrict the amount traffic not associated with an event (emergency, marathon, etc.). For that matter, an area can be isolated for a local event and other traffic routed around that area, so that the local event doesn't completely break a chain.

The big problem I see here is that hams don't like to be told what they can do and where they can do it, and to allow some autonomous machine take over the configuration of ones own equipment is unthinkable. Thus we will never realize a truly workable solution to APRS being plug-n-play or for that matter effective nation/world-wide packet networking.

Want to prove me wrong? Go ahead, make my day ;-)

I have done what sounds like the same thing. I connected DB-9 and DB-25 connectors in parallel to the Garmin GPS-45 power/data cable so that the GPS-45 talks to both the KPC-9612 TNC and the computer. Also the computer can talk to the GPS-45 (e.g. running Gardown to upload waypoints). My laptop has only one serial port.

However the computer cannot talk to the KPC-9612. I have thought about putting a DPDT switch next to the DB-9 connector so it would switch data in and data out to the computer. Then I could switch the computer between the GPS-45 and the KPC-9612.

I set the internal jumper in my KPC-9612 to connect its internal 12 VDC power to pin 25 of the DB-25 which is connected to the GPS-45 power lead. I also connected a coaxial power jack to the power lead. With this setup, I can power both the KPC-9612 and GPS-45 from either the coaxial power jack in the cable or the one in the KPC-9612. With the coaxial power jack in the GPS-45 cable, I can also power the GPS-45 by itself when it is not connected to the KPC-9612.

WOW! Good catch. I had been frustrated over the last couple of days grabbing data. I'm just about to call 'em and say, "What gives?" Don't know if it will help, but we can try.

> One of the readme files said that the .OPT and .STD data would be

Apparently so! I'll post more after my conversation with 'em!

Regarding WIDES and RELAYS....

Since APRS KNOWS WHERE all the stations are, it would only take a little software to have APRS change the path to RELAY or to WIDE based on its knowledge of the PATH to either the nearest WIDE or nearest RELAY..

But until we get ALL APRS users to understand what HEIGHT ABOVE AVERAAAGE TERRAIN MEANS, and to put it in their POSITS, this would be a wasted exercise...

I just got off the phone with the EROS Data Center Customer Support folks. They were as surprised as we were! I should be hearing back from them as to where we can get the .GRA files, -OR- some mechanism to convert the "new and improved" SDTS format.

More data as I obtain it!

Hello Group:

Many thanks to all who so kindly responded, including Ted, D.Barrett, Rick and Gerry. All of you quickly identified the need for my usage of the UNBLOCK routine to add cr/lf's to my decompressed map files. I have processed the files as you suggested and have successfully created a nice local street map of my area of Santa Barbara. Thanks again for your help !

There are many many digi owners that don't understand what ABOVE AVERAGE TERAIRN REALY IS!. We have one here in Alabama (I won't mention the call) that is the BIGGEST EGO DIGI in the south. His coverage circle just touchess my qth, in reality meaning i should be able to hit him with an HT. But the reality is sometimes i can't even hit it with my stacked 13B2's +300w pointing right at it. At the outset of the digi first showing on the map i had made a call to him discussing how important this item is to the users. Well the only answer i got from him was that he knows all about this stuff "I have been a ham for 30 years" What he did was took the hight of the mountain and added his tower height to this figure, and that is his HAAT. All i have to say to the old timers (Learn the new ways and technoligy). Go ahead with the flames I'M AN OLD HAM O CAN TAKE IT, don't the call fool you in to thinking i'm a new ham hi.

This is a minor tweak in features, and some re-writing of some of the README files to catch up :

- * Fixes DOZ Crash if you bump the mouse
- * Adds U/D/G to MAPS menu commands for single finger mobile ops for laptops that do not have separate PgUP/DN/HOME keys
- * Adds F3/4 keys for bringing up more/less map labels. Useful for mobiles in areas with little activity to see more labels at higher map ranges
- * Adds MKMAPHK1.bas to distro, but you need QB.EXE not just QBasic to run it. So get MKMAPHK1.EXE from the SIG. (makes 100k maps easier from USGS CD)
- * MOUSE ZOOM not limited to only factors displayed on MENU BAR. Zoom by factors up to 1024 or more by clicking beyond ends of ZOOM menu
- * Averages WX stn wind speed over last minute
- * Added South Pacific MAP to WEST distro and some islands to WORLD (Maps done by W7KKE)
- * Added Glasgow Montana map to CENTRAL distro
- * Changed name of MONTANA.map to MTState.map

Ver 74a was on ARN BBS for about 6 hours when I got a LATE bug report on 74, so I re-did it all as 74b. Am uploading 74B over next hour or so, wo wait until 2200z before you ftp. It is on ARN BBS 410 280-2503 now.

Look for either APRS74b.zip, 72cto74b.zip or 73dto74b.zip

66. USGS 1:2M data format change!

From: Gerald J Creager <gerry@cs.tamu.edu>
Date: Fri, 3 Nov 1995 15:02:17 -0600 (CST)
To: aprssig@tapr.org
Message-ID: <199511032102.PAA02223@solar.cs.tamu.edu>
Rendered body type: text/plain

I just talked to one of the Customer Service Reps. Per a mandate from Reston, VA (the home of USGS) there was a format change consistent with USGS maps and data formats. It was not carried out consistent with their normal mechanism. In fact, the Customer Service Reps didn't know it was gonna happen!

I've been advised to send a FAX detailing what we're doing with the 1:2M data, and what the potential impacts of the loss of this data are. Of note, the data are still available, "for a fee."

>From where I sit, and based on the EROS announcement that they're trying to make all products available via internet, this looks like a policy change or violation. I'm suggesting we all FAX the following folks, with a reasoned, thought-out letter concerning what we do with the data (Maps for skywarn, public service events, etc), what the impact of unavailability is (new tools required to create these same maps, with the requisite time to develop these), and our desire to see 'em back up.

Donna Scholtz 605-594-6589

You can send similar information to glis@edcserver1.cr.usgs.gov, with a note directing this to Sandy Spanton and/or Donna Scholtz.

Fire up those word-processors, folks!

Depends on what you have to do with it. I happen to use a lot of the coverages here at work. And, it is a matter of principle: They should not claim they're going to make data available, and then snag something back without notification! C'mon Bob, your work for the government! There are mechanisms and procedures to follow, especially when you have a user base. I was told they didn't even follow their own procedures.

FURTHER: It takes me more hard disk space to process the CD data using xtract than it does to do the manipulations I'm doing right now. And, I can flush the files when I am done, knowing I can get 'em back later via the net. Remember, at work I am on a T3, so I have decent bandwidth. I was IO limited by the FTP server over at USGS, and they have fixed that now!

```

```

CD caddies are at a premium. And I have to hit a number of areas. I don't have a CD jukebox handy that'll mount 32 CDs. Nope, I think I'll continue to depend on the network that I've lived with for the last 13 years. It's served me pretty well!

> Am I overlooking something?

Well, not to be too harsh, but I think so!

Aloha de Dave/WH6YC. Have been using the new MakeMap program deriving DLG data from the USGS 1:100,000 CDR0M (off the actual disk, vice FTP). I easily created about a dozen ONE mile maps and have been checking them for alignment with the various island maps. I have confidence in the accuracy of my 1:2M derived maps of Oahu and other islands, as they been error corrected w/GPS using the HST overlay method. Now I find that the smaller "street-level" maps don't line up very well, at the ONE mile map range. Have found them to be about 3/4 to 1 inch up and to the left of where I think they should be. Accordingly, I edited the map to move the origin and center coordinates down and to the right by .003 each. This gives me a much better alignment, although not yet perfect.

Has anybody else using this program checked the new maps against existing one's for alignment? If so, what did you do to correct the alignment?

Back to the beach. BTW, it snowed on Mt. Haleakala on the Big Island yesterday. But I still went to the beach anyway. 10-12 footers expected today/tomorrow on the north shore of Oahu, as a storm front passes to the north.

Aloha, Dave.

MacAPRS works with the Ultimeter and now also the Heathkit Weather Station.

It does not work with the Davis unit, if it did, I would have given the info on how to do it to Bob a LONG time ago..

Recently the DAVIS unit was seen by somebody for sale in a DAMARK catalog (an electronics clearance house). Could this be what was seen?

Also, Last time anyone checked, DAVIS wanted programmers to sign a DAVIS EXCLUSIVE agreement in order to get the info to hook up to their equipment.. NO THANK-YOU...

If someone went to the trouble to reverse-engineer the DAVIS stuff and give it to me, I might implement it, but I am not very interested in their DAVIS ONLY attitude..

Yes, I think a few folks still do not know what HAAT is! We have user now (sort of nearby- well within 1 digi hop range)that has decided to use that big EG0tower symbol and set his PHG to 9993. And this is on his home station.

His circle covers most of Alabama, GA, TN, and a little of SC, and KY and MS. Figured out who it is yet?

I think we should lead by example, and this is a poor example for the new users now coming on line.

And Bob, I like the new, smaller house symbol. Could you please get rid of that tower symbol. Not only does it feed the EG0peaters, but it takes up too much room on the screen as well.

We have also got a person who is running his UNproto as Relay and has his

home station set to WIDE. He's not cooperating with anyone or responding to messages and he did not work with the net when he did this. He is 5 miles from a WIDE on a 180 ft tower and you can imagine the horrible QRM being caused. We have put him in the Budlist of two digis to try to get his attention, but he can still hit a WIDE that is about 75 miles away.

How do the rest of y'all handle operators like this?

And Bob, what about making it require being registered before being allowed to set your alias to wide?

84. Cooperation & Ego's

From: W2H0B@aol.com
Date: Fri, 3 Nov 1995 22:20:16 -0500
To: aprssig@tapr.org
Message-ID: <951103222015_80798329@emout05.mail.aol.com>
Rendered body type: text/plain

For those of you who are having problems with folks having big egos, I feel
sorry for you.
It's a shame, but up here in Jersey, we did a mature and logical thing... we
had a meeting!

Those of us who had been working with APRS a while (and with packet in
general) and felt reasonably comfortable with things, got together and talked
about the "network". My feelings
were if nothing at all was done, 145.79 would suffer the demise of all the
other packet freqs.

You know... congestion and pandemonium! I felt we had to plan, stick to such
a plan, and encourage everyone else to "see the light" and stick with us.

We had the benefit of Keith WU2Z in attenmdance... showing us the MAC version
as well as enlightened commentary on several aspects we wanted to persue.

After an agreement to place WIDEs at strategic locations, we then set about
to "mention" to clubs and on-the-air chats that the
"WIDE Net" was almost in place, that no more would be encouraged, and users
could now set
about to USE the WIDE Net for GPS mobiling, weather stations, DF'ing, etc
etc.

It's worked and while we're always interested in tweaking the Network we're
careful about it.

Users in Central and Southern New Jersey have settled into the comfort that such a net exists;
they didn't have to finance anything. They can now "play" to their hearts content.

We have pie-in-the-sky ideas yet to be built, and, we'll get there... just takes time and money
but what the heck! My point is... get everyone concerned to sit down and talk it out. Plan on an
8-hour day meeting... bring in food... we had a real good time. We planned for another, but
time and schedules haven't allowed that yet.

Only modify the plan with everyone having some input... no one should be the "boss".

Of course, I wish you all could have the good luck and good intentions found in Jersey.
But, I know the best laid plans of mice and men... ho hum!

Oh well... my two-cents for what it was worth.
Above all, have fun.

From: William Nolle <wnolle@intercomm.net>
To: bruninga@nadn.navy.mil

By the way i now have 120 detailed maps for Alabama (63 for Birmingham alone) With this new software i can make a very detailed map that just borders 2950 points inside of 6 minutes (Of course this is with a 90Mhz Pentium).
The program does have a few bug but i have learned to work around them.

87. MKMAPK1.EXE ERRORS

From: intercomm.net!wnolle@tapr.org (William Nolle)
Date: Sat, 04 Nov 1995 03:03:46
To: tapr.org!aprssig@tapr.org
Message-ID: <199511040903.DAA20052@sys1.tapr.org>
Rendered body type: text/plain

Someone on the sig asked for me to post the errors you get with this program and how to get around those and get good maps. Well there's one error message you always get and that is the following:

STOP in line No line number in module MKMAPK1 at address 1562:1199

Hit any key to return to system.

Just totally ignore that one by hitting any key hi.

When making a very detailed 2 mile map you probably will never even finish before either your system locks up or get the following message:

Device unavailable in line No line number in module MKMAPK1 at address 1562:051D

There is no way around this one, i have found that you just cannot make a detailed 2 mile map AT ALL so don't even try. you may get away with a smaller range like 1.5 1.6 1.7 etc. even if it makes it all the way trough the chaining segments portion of the operation you will find a file with no data in it at all.

Now i have found that as stated in the doc file that with some maps aftyer the chaining secment process, then hitting a key as stated will make a mess ot of the map. In most cases you will find that be deleting your map and then renaming the XXXX.DAT file will give you a good map that in 90% of the maps is below the 3000 point limit anyway. In some cases i only had to trim a few points from the outside of the map.

I have timed the building of a very very detailed 1 mile maps and over 5 maps it didn't take me more then 25 minutes (That of course is with a 90Mhz pentium). I have build a total of 137 maps since downloading MKMAPK1.EXE and i guess have already been appointed Alabama map coordinator Thanks Bob hi. Also a little tidbit i will use Birmingham Alabama as an example. I first make a 10 mile map with the -10 i then take this file and draw my map gridwork on it with 1 mile gridwork. I then know ahead of time how many maps it will take. Then i take a coordinance reading in the top horizontal row and first vertical row, from then on you will be able to figure the coordinance for the whole gridwork. I hope i'm making this clear enough. I'm lucky to have a programmable keyboard. I program all the coordinance for a whole row of maps that way and also all but the last character or letter of the map name. and also a key telling the system where to find the CD files. Well i hope this will be of some help to the person that has had problems using MKMAPK1.EXE

Steve,

Bob Bruning seems to be completely un-interested in the PK-900. I've ask him for help twice now even volunteering to help in one case and he hasn't bothered to even reply. Mine is working in either hf or vhf mode, but I have to switch it manually. Use the switch character to select radio 1 or radio 2. The default switch character is the vertical bar (|). The channel selection character follows the switch character. So to select radio 1 (HF)

type: |0 (Enter)

and to select radio 2 (VHF)

type: |A(Enter)

Be a little careful since the PK-900 isn't supported and I've found the program will reset things like hbaud and vhf on radio 1.

Drop me a note if you are still having problems. I've been able to make the pk-900 rec/transmit on VHF while receiving on HF, thus getting 75% functionality.

Wonder if anyone knows anything about the Ultimeter 500? looks like it's a later version of the Ultimeter II...the price is more in my budget than the 2000.

Does APRS now support the Ultimeter 500, if so I plan to order one of these nicer but less expensive than the Ultimeter 2000?

Been reading the mail in this sig for about 2 weeks now & it really is a big help to a newcomer like me. Thanks for all the help.

Bob,

Is there any chance that a future version will support an option to turn *off* the track footprints, and only show the current position of map objects? Such an option would make using APRS at public service events easier, by eliminating the need to periodically press the spacebar to clean up the display. Busy events tend to clutter the display quickly. APRS would function a lot more like professional AVL systems used in public safety dispatch centers if such an option were available.

There are some applications where the track footprints are nice to have. I don't think they should be eliminated altogether, but it would be nice to be able to turn them off.

Jack

I agree... However, I would still like to see the last position
updated. I wonder if there could be several ways to display this? Erase
the last position, Erase the last position then replace the new one every
screen update, or display your object and place the callsign(s) somewhere
else on the screen?

Rendered body type: text/plain

I can not turn off track footprints.

The way I am writing them to the screen, I can only write something over them, not erase them. If I write BLACK, then that destroys the roads and anything else they pass over. SO I write a BLUE to at least show you the difference between the LATEST track and the old ones.

I could use the EXCLUSIVE OR screen write function, but then would LOSE the ability to have objects be different colors to indicate different status... such as WHITE for live, gray for OLD, CYAN for DR, GREEN for wide, etc...

> >going through to get the same data over the internet...

TYPICAL REPLIES SAID:

> Yea Yea. But gee Bob for those of use that can't program neat stuff like you
> have we have to find some other way to suffer :-) I think most of use do it
> that way just because we can, who knows?

APR REPLY: Chuckle, chuckle. I was not calling anyone cheap, hi hi.. But I can access the CD in about 5 seconds without having to fight for the phone line from my wife or kids, and NOT having to suffer through the delays of the internet, and NOT having to suffer data and link outages, and NOT having to learn something NEW such as how to ftp and unblock files... And these days a CD ROM drive only costs about \$79...

FINAL POINT: hi hi

And you dont need to know anything about programming. Just put the CD in your ROM drive, run MAKEMAP.EXE, tell it what LAT/LONG and range, and come back in 15 minutes to have a complete 32 mile map from the 2,000,000 ROM. There are a few more steps for the MKMAPHK program, but they are all explained in the docs... Also, you may spend another hour playing with the map in MAPFIX getting rid of a few more redundant points...

Bob:

I have looked high and low for the usgs CD ROM and can't find it. I know that we are rural, but... can you help. I do have access to PHX, TUS, and FLG. They are the top 3 cities here in Az. Any help would be appreciated. Right now I am using MS's AutoMap to make local maps for the gang out here that want then.

Thanks for your help,

Alan, WC7R

FOR THE NTH TIME: The ADDRESS and 1-800 PHONE NUMBER FOR THE USGS to get the CD ROMS is in README\MAPS-CD.txt included in every distribution copy of APRS. I am not multi-tasking, so cant go look it up for you on this

PC while reading mail...

READ THE DOCS so you get the right format.

>the difference between the LATEST track and the old ones.

I thought this might be a problem. I can remember when moving the little yellow circle cursor would erase anything underneath it, but not too long ago you made a change in the way the display was handled, and that stopped happening. I thought that maybe it could apply to objects too.

I need to post a message later about the results of my first OMNI-DF attempt today, but a quick question - I hooked up my new PK-12 for the first time today using 74B and HSP mode. Everything seemed fine at first, but then I noticed I was not getting any other objects on my screen (other than my own mobile), in spite of being in range of local WIDEs and home stations. Closer inspection showed the received data coming in at the bottom of the screen, but other posits and beacons were all coming in as follows:

No> (full posit or beacon here)

i.e., all received data from the TNC had "No>" in front of it. Any ideas? I'm

stumped...

Jack

110. Tweaks to MKMAPHK1 generated maps

From: KSwaggart@aol.com
Date: Sun, 5 Nov 1995 22:01:30 -0500
To: aprssig@tapr.org
Message-ID: <951105220129_13781677@emout06.mail.aol.com>
Rendered body type: text/plain

Yesterday I cranked out seven 1 to 2 mile detail maps covering the San Francisco peninsula using MKMAPHK1. It really works slick. If you are still using my CONV100C, can it and use MKMAPHK1.

Today I drove around until the laptop's battery died and collected some ground truth GPS data to check the maps. Upon overlaying the GPS data I noticed the positions were consistently off about one city block in both the vertical (N/S) and horizontal (E/W) plane. I adjusted the map's origin lat by +.0002 and the long by +.0006 with a text editor. These corrections probably only work here in the San Francisco area, but I pass along the info so you can find your local correction factor, if any is required. The correction was the same for all seven maps, so I suspect it may be a difference in the datums between my GPS and the CD ROM USGS datum. My GPS was set for WGS84.

111. Anymore Calif maps out there?

The NO> means that there is NO > symbol found, that is the separator between the FROM callsign and the TO callsign. APRS could NOT find that > char.

Looks like you had HEADER ON, so that the HEADER was on a different line than the PACKET data itself?

113. Power Height Gain

Rendered body type: text/plain

OK, guys, I'm starting to get P@#\$%\$#@# about these PHENOMENAL range rings!

IF YOU CANNOT HIT EVERY STATION *DIRECT* THAT INTERSECTS YOUR CIRCLE,
THEN YOU'RE LYING!

EVEN if you calculate it according to what ever equation you use, but you
cannot work stations within your circle, then it is WRONG!!!

STRIVE to make your PHG ring MEANINGFUL. TEST it, study it, drive
around, show off your knowledge of topology by trying to make your PHG
ring REAL... OFFSET it if needed.

A range ring BEYOND usable reliable range from your station should be
considered an indication of your own selfish ego and stupidity. It does
NOT indicate what a neat site you have. AND IT JUST LOUSES up any
network planning and operations.

Yes, I am yelling tonight, hi hi..

NOW, I KNOW THERE ARE PROBLEMS:

- 1) unfortunately, the PHG format only permits CIRCULAR patterns, so
it can never truly represent a REAL pattern, but ERR on the
conservative side. Make the circle closer to the MINIMUM range
not the MAXIMUM in one direction.
- 2) the APRS format DOES permit you to OFFSET that circle in a given
direction. This gives a 3 to one favoring in the maximum direction.
AND of course, minimizes a poor direction..
- 3) If you use a rotatable BEAM, which is not PERMANENT in one direction,
then your antenna gain should NOT be your antenna gain (say 10 db or more,
but should be 0 or less, since anyone trying to contact you will probably
NOT be in your main beam. In fact, you should probably indicate -6 db or
more, except that APRS does not permit negative antenna gains.

THINK about the service that these PHG rings provide. They tell OTHERS
at what range they can use you as a RELAY. IT IS FRUSTRATING to drive
into someone's PHG ring and NOT be able to use them!

*FLAME OFF.....

Im not that mad, hi hi, just tired of seeing the same ol digi on my map
for the last 2 years with a range ring going out 70 miles in all
directions which cannot be worked within 30.... in most directions...

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

Perhaps there may be a way you can tackle this. One could write a routine
to examine and extract data about distance to stations heard direct. One
could look at the location of stations heard direct and compare it to your
station location to see the distance and direction. This data once gleamed
could be utilized to provide information on accuracy of the PHG setup.

I am fairly sure this is possible based on the fact that I have noticed
that the TNCs seem to annotate with an asterix whether data is direct or
digi'ed and if digi'ed which one it was that transmitted it.

How could this data be utilized? I would think that would vary from just
displaying it (on a screen you could call up) to using it to modifying the
PHG. This data would be most useful after prolonged station operation
(thus the need to log it in some form) and only if there are other stations
out there.

The other part of the PHG that bothers me is when I using my mobile setup.
When I do that I put in my power (50w), my gain (7.5dB), and my height (0

or 6'). No matter what though I effectively have a range circle that is non-existent which seems to imply that I can't hit anyone ... but obviously I do ... but I guess I am applying it where it wasn't meant to be applied.

Reference the lack of PK-900 support in APRS.

I cannot speak for Bob, but two things might help:

1. Spell his name correctly. Showing you care might improve his desire to take an interest.
2. Offer to loan him a PK-900 manual so he can figure out the differences. You can't expect him to purchase an expensive TNC just to update his code.
3. Best of all, work out the problems and when you get it right, send him the information so he can put it in the DOC files for others to benefit from.

Bob is writing the code and has years of experience with this stuff, but this is a community effort - making maps, checking out new TNCs, etc. If you need help, the first place to look is in the mirror.

I found something very strange trying to make some maps from the 100K CD using the new software. I first picket full blocks on the CD because i wanted to do some maps of I65 ll the way from the TN line down to the coast. The total disk soace required was 179.436 Meg. Now when starting the map program i entered the coordianance of 33,5343N-86,8431W @ 8 mile range, Well the software told me that there was no data points for the coordianance of 122.05N - -222.5167W at this map center. Now i can't figure out if it's the CD's problem or the new 100K map software!. In other words maybe you can't select full size blocks because it will induce errors!!. Go figure....

I've coded such a routine in turbo pascal.

Program reads and parses BACKUP.BK (or whatever filename using same format), solving the spherical triangle it computes the distance from each station to all others, and outputs to a filename of your choice. I call the program RANGE.EXE and would be happy to distribute it to selected users as a Beta copy for critical review.

I've used it to get a first order appraisal of station proximities here in South Florida.

How do I get it to y'all?

William Manley (KB4XE) - further from Great Lakes than Bob!

Well i just found out that's it's not the CD-Rom creating the error it's MKMAPHK1.EXE that cannot handle that many files being in that directory. I did the same thing again but only picked all the 15" cells from the first two blocks covering that area then it worked. I did find another problem tough and that is you can't import a map done by MKMAPHK1.exe into MAPFIX16.EXE and still maintain the quality of the map. Mapfix16 will make the otherwise smooth curves look like staircase steps completely unexeptable Well back to the drawing board i guess, MKMAPHK1 is great for making those 1 and 2 mile street level maps tough. I have found out one thing with making all these maps, APRS users grab them up like they are made of gold. I even received several phone calls from users wanting the maps that was after i posted the whole bunch i had onto a BBS. That's just great i think.

My GPS was
 set for WGS84.
 What does that setting mean?
 What different ones can you use?
 What is the difference?
 What criteria do you use to pick one?

125. Re: [APRSSIG:4225] \$32 CD ROMS

From: dwetzel@acs.uswest.com
 Date: Mon, 6 Nov 1995 08:13:39 -0600
 To: aprssig@tapr.org
 Message-ID: <09e1d270@acmspgw1.mnet.uswest.com>
 Rendered body type: text/plain

BOB, APR SAID:
 > >USGS data. I donno about you guys, but the \$32 I spent to get the entire
 > >USA CD ROM at the 2M scale sure is a LOT easier than what you guys are
 > >going through to get the same data over the internet...

TYPICAL REPLIES SAID:
 > Yea Yea. But gee Bob for those of use that can't program neat stuff like you

> have we have to find some other way to suffer :-) I think most of use do it
> that way just because we can, who knows?

APR REPLY: Chuckle, chuckle. I was not calling anyone cheap, hi hi.. But I can access the CD in about 5 seconds without having to fight for the phone line from my wife or kids, and NOT having to suffer through the delays of the internet, and NOT having to suffer data and link outages, and NOT having to learn something NEW such as how to ftp and unblock files... And these days a CD ROM drive only costs about \$79...

-----> My wife doesn't complain about the phone line, but the \$79 for the cd (and \$32 for the ROM) gets a LOT of attention! 8-)

Doug
KC7CO

FINAL POINT: hi hi
And you dont need to know anything about programming. Just put the CD in your ROM drive, run MAKEMAP.EXE, tell it what LAT/LONG and range, and come back in 15 minutes to have a complete 32 mile map from the 2,000,000 ROM. There are a few more steps for the MKMAPHK program, but they are all explained in the docs... Also, you may spend another hour playing with the map in MAPFIX getting rid of a few more redundant points...

Since I joined the aprssig, the majority of what I've seen is slings and arrows thrown at Bob's program. I don't understand. Bob has developed a very powerfull, usefull, and enjoyable computer program. The program has applications from emergency service, community service, to just plane HAM fun. This program is extreemly powerful and complicated, and occasionally has had a bug or two. I have tried to point them out, to Bob, when I have discovered them, and only after I have exhausted every possible "fix" that I can try, as an end user. I then detail the problem, in depth and explain what I did and what the program did, I work with others to try and find solutions, and will tell Bob what the common conclusion is.

Most of us appreciate constructive criticism, but to harang the author because the program does not do everything that you think it should is wrong. I use the PHG and sometimes see rings. I could'nt hit one if my life depended on it, using any protocol.....does that mean that the program is flawed???? NO IT MEANS THAT I LIVE IN THE PEOPLES REBUBLIC OF HAISLEY, WITH VERY RESTRICTIV CC&Rs, AND AM RUNNING A SPIDER HIDDEN IN MY ATTIC!!!!

If we are not careful, we are likely to enrage Bob to the point that he pulls his program, or starts charging for it.

I, for one, want to send a big THANK YOU to Bob. I really enjoy the program, and discovering the new things that I can do with it. I would hate to see it

ps: No hate mail Please

Apparently some SYSOPS are so concerned that their digi show up as GREEN, that they are putting WIDE-RELAY in their BTexts even though they do NOT have RELAY aliases. You can imagine the plight of a mobile driving through using RELAY,WIDE, and his anger after working on his station for hours, to find that the DIGI was NOT a RELAY..

Sorry, there is no way to know what aliases are in a TNC on the air. We have to trust the good sense of the SYSOP's in properly beaconing the real status of their DIGIS.

Digis should ONLY have WIDE-RELAY in their BTexts if in fact, they ARE operating with the dual alias of RELAY and WIDE. TO do otherwise is a great disservice to their network and travelers.

The SYSOP said that since everyone in town was already RELAY, that using the DIGI with an alias of RELAY would be a disaster. I disagree. ONLY MOBILES should digi via RELAY,WIDE. And mobiles have such poor height and 0 db gain antennas, that they usually hit only the DIGI anyway. I agree that a HOME station in the middle of things should NEVER go via RELAY

In the docs for MKMAPHK it clearly says to ONLY put CD data files that you want processed in the directly, nothing else. What this means is that MKMAPHK will try to proces EVERY point in every file in that directory. This also means (I am guessing) that he had to make some assumptions as to how big to make his arrays to handle all these multiple files. SOUNDS like you overloaded it by an order of magnitude, hi hi

WOAAHHHHHAAA guys, Embarrassed grin,... There is a PK-900 down the hall in the Academy Club station, and a Manual too, I guess....

Its just a matter of cables (time) reading the manual (time) and figuring out how to talk to a PK-900, (time) so I guess you can say its on the list of things to do... But since the PK-900 is probably owned by 1% of the APRS users, there are a lot of other things on the D0 list in front of it, hi hi....

While I'm in the mood for flaming, (Grin..)

In the next version of REGISTER.DOC, you will see an additional line item on the list of options.

It says that if I have to take 2 hours off work to stay home until the POST OFFICE opens at 9AM and drive over there to sign for your REGISTERED OR CERTIFIED LETTER, then it will be an additional \$80 charge...

Look guys, In todays world, most families HAVE NO ONE AT HOME when the mail comes, please consider the EXTREME INCONVENIENCE you are placing on the recipient of your CERTIFIED or REGISTERED LETTER. Most of us also commute 45 minutes to 1.5 hours to our work, so we cant even get to our HOME post office during lunch hour either.

You can imagine how I feel when I skip my car pool so I can go to the P.O and get a letter (which for all I know, could be from the IRS or FBI, or whatever, only to find it is some old retired kodger who wants to have a return receipt for his \$24 bucks...) Another 2 hours of programming time lost...

Wow, this FLAMING could get adicting, hi hi. I have a lot of other pet pieves too... but I guess they are not related to APRS (grin!) :-)

```

It does, indeed, work well. I still use CONV100x for other maps that either require handcrafting or more/less detail than mkmaphk1 will provide. For instance, sometimes I need to keep street attributes consistent rather than let mkmaphk1 chain them as it will. For this, I do it manually. With all the practice I've gotten, a manual session takes about 2x a mkmaphk1 session if I've got it planned out properly.

```

> ...

```

That is consistent with the offset for NAD-27 vs NAD-83/93. WGS 84 is similar to, for the most part, NAD-83/93, but not exactly the same.

I'll see if we can generate a plane change parameter for selected parts of the country.

USGS data. I donno about you guys, but the \$32 I spent to get the entire USA CD ROM at the 2M scale sure is a LOT easier than what you guys are going through to get free data, hi hi

And since most folks are only interested in streets in their states, it would seem like purchasing one of the 100K CDs for your area is also \$32 well spent. (to avoid being dependent on networks and someone else's up/down computers..) hi hi

Am I overlooking something?

Yes, - the challenge of going where no man has gone before!! ;-))

David W. Barrow III sez:
>
> My GPS was
> set for WGS84.
> What does that setting mean?

That is the basic map datum (the reference ellipsoid) for the GPS mapping system. In general, for GPS applications, leave it there.

> What different ones can you use?

About 250 different datums, and an infinite number of other ellipsoids you can define mathematically. Depending on which maps you are trying to reference to, select the ellipsoid of choice.

> What is the difference?

Arithmetic. :-) Seriously, if you're in, say, New Zealand, use a map datum appropriate for that area and for the mapping agency who drew the maps you use there.

> What criteria do you use to pick one?

If you are continuing to use the hardware and maps in the US, your choices, in order of preference should be, WGS-84, NAD-83 (or NAD-83/93), and NAD-27. Almost 100 of the 250+ I'm aware of are permutations for the US, and not generally useful save in a special circumstance... we just defined a new Datum for our local use here at Texas A&M, based on over a year of work and data analysis. That particular datum refers back to NAD-83/93, but is only valid within 100 km of College Station, Texas. I do *NOT* use it save for our Trimble 4000SSI surveying hardware.

That is normally a function of the site, or the keeper thereof. IF all of the stuff in a directory is something you've uploaded, then you can reasonably do that.

An alternative is to start the practice of uploading a filename.dsc description file, and then the keeper of the site could reasonably expect to organize such an index. Asking everyone who uploads to a site like the aprssig on tapr.org is not really a good idea.

After making 13 100K maps using only ROADS no water body's or streams in the city of Birmingham Alabama with 95% street coverage, here are the results.

At -8 mile range, got an error and no data was saved

At -7 mile range. Passed but heavy stair stepping.

(Notice this Bob NOT mapfix.exe)

At -6 mile range. Passed but heavy stair stepping

At -5 mile range. Passed but heavy stair stepping

At -4 mile range. Passed but heavy stair stepping

At -3 mile range. Passed but heavy stair stepping

At -2 mile range. Good exeptable map

At +1.5 mile range. Error no data saved

At +1.4 mile range. Error no data saved

At +1.3 mile range. Error no data saved

At +1.2 mile range. Error no data saved

At +1.1 mile range it locked up my computer.

At -1 mile range, Screen was scrambled and looked a mess but after deleting Test.map and renaming Test.dat to Test.map then using MAPFIX16.EXE Test.map came in at 3005 points without doing any trimming or scrunching.

This tells me that MKMAPHK1 is great for those 1 mile range maps in a heavily populated area NO BIGGER. If you care to try this the coordinance for Birmingham,AL i used where 33,31.24 N - 86,49,53W

I figured i would post this here and save some of you a lot of waiting for a map to get done then only to find it didn't give you what you wanted. Because i would expect with a slower computer this could be realy a long wait to find out you didn;'t get a map at all.

I didn't make that error (this time :-)) and gardown.exe (not the .zip) is not doing anything but locking up my machine.

Hi Again,Bob?

Don't let these guys get to you. But the more APRS users there are out there
and the bigger and better the program gets, the chances for more and more
gripes from the population of users. The only advise I have (which carries
no weight at all is) try not to let the program get to big and complicated
for us dummies, of which I am sure there are many. Hi. Anyway, I have no
gripes or complaints. 73

Heard a rumor that HAM radio is NOT going to be used AT ALL this year for
the cross country running of the Olympic Torch. The RUMOR says that
someone teamed up with Radio Shack to use bazillions of CB's. BUT THAT
on-air tests (without repeaters of course) are leaving the organiziers
real worried about being able to communicate on CB... over the needed
distances..

TWO THINGS COME TO MIND!

- 1) HAM RADIO needs to waltz in and save the day
- 2) I cant imagine anything more FUN than putting a GPS/TNC on the
OLYMPIC TOURCH CHASE VEHICLE with the path of RELAY,WIDE,WIDE,WIDE!

[Then waltz into your local TV station with your LAPTOP]
[and show them what you can do! Dress well!, Shave.]

If anyone can substantiate this rumor and can find someone in charge and
suggest A GPS unit on the Olympic Tournch, I bet you would have NO
PROBLEMS GETTING PACCOMM or one of the other TNC MFRS to donate the
equipment! But who has their foot in the door?

AND ATLANTA IS WIRED FOR APRS!

- > I'm having trouble with my DF validation #. After I entered the number
> and saved to the config file, the program started beeping bad # in the
> upper right hand corner of the screen. I take this to mean the

THE BAD FILE NUMBER MESSAGE CAN MEAN 2 THINGS:

- 1) APRS could not find a file in the APRS\SYSTEM directory (not likely)
- 2) BAD COMM PORT CONFIG, Port number, PORT in-op, PORT not enabled or
anythig else wrong with your COM port. SInce you are trying to config
for DF, I assume that the problem is in how you configed your DF COM port.

APRS ONLY can use COM1 or COM2. You can CHEAT by using the SAME
interrrupts for 3 or 4 as you use for 1 or 2, then, and only then, can

you use COM3 or COM4.

Hoe this helps everyone...

AGREED!

> This program is extreemly powerful and complicated, and occasionally
> has had a bug or two.

"ocassionally" ? No, more like 'usually'

"powerful and complicated" yes, but I think *unnecessarily* complicated. Bob had grown up with the program. He knows it inside and out. He knows where the command is to do everything. He seems to have forgotten that those of us not as well versed as him do not know where everything is. The help screen(s) are not complete. The documentation is scattered in a dozen files. Some of the documentation has not been updated to reflect changes that Bob has made.

> Most of us appreciate constructive criticism, but to harang the author
> because the program does not do everything that you think it should is
> wrong.

Bob shouldn't be 'haranged' but if the program does not do what the author *says* it should do, then he needs to address the problem.

> I use the PHG and sometimes see rings.

Don't understand this....I see rings only when I type the command for them.

> I could'nt hit one if my life
> depended on it, using any protocol.....does that mean that the program is
> flawed???? NO IT MEANS THAT I LIVE IN THE PEOPLES REBUBLIC OF HAISLEY, WITH
> VERY RESTRICTIV CC&Rs, AND AM RUNNING A SPIDER HIDDEN IN MY ATTIC!!!!

Don't understand this either. The only reason for you not to "hit one" is if your and/or the other stations PHG rings are not an aproximation of true coverage. If you have a 'poor' antenna system then your PHG info should reflect this.

>

> If we are not careful, we are likely to enrage Bob to the point that he
> pulls his program, or starts charging for it.

I sent some money to SOMEONE!!!! Guess it wasn't Bob ;-)

> I, for one, want to send a big THANK YOU to Bob. I really enjoy the program,
> and discovering the new things that I can do with it. I would hate to see it
> dissappear.

Thank You as well, Bob.

A little background here..... I have been on 'regular' packet for about three years now. I *never* left my station on when I was not there. I turned it on, checked my PBBS and shut it off.

Since I've discovered APRS not only do I leave my station on 24 hrs a day (running APRS) but I now have *TWO* APRS stations both running 24 hrs a day. One of which will soon be a WX station.

At my next radio club meeting I will give a talk about APRS, trying to 'open the eyes' of some fellow club members and maybe even 'light the fire'! I give floppies to anyone who will take them.

I am truly "excited" about APRS, its current capabilities, and its future potential.

But that does not mean that I think the program is perfect, or that Bob could not improve things even more.

The datum you set in your GPS should use the same datum as the maps. Different surveys at different times used various datums. Positions derived using one datum will show errors when plotted on maps derived from a different datum. Not necessarily big errors unless you're trying to target a cruise missile through someone's office window.

None of the surface maps I have show what the source datum was. The aviation charts show the horizontal datum as "North American Datum of 1983" or 1927. My Magellen book says to use NAD27 for North America (this is the North American Datum of 1927). Since I am using WGS84, (World Geodetic System) I may have not needed to correct my maps if I had selected NAD27! Oh well..... I suspect the USGS CD ROM data was based on NAD27.

I know WB4APR is right when he says we really don't need to be this accurate, but it sure fun trying to get the most out of the GPS and APRS. Get that little car symbol tracking right on that street in the .25 mile scale!

I called the USGS at 1-800-USA-MAPS & listened to several recorded messages with Menus, etc...Finally after talking to a real person, I obtained the toll free No. where you can actually buy the CD Roms. That No. is 1-800-435-7627.

To obtain the CD Rom of your choice you must fax your order to them, they will not accept an order over the phone. That Fax No. is 303-202-4693. Include all

the necessary credit card info, plus your ph. no. Also add \$3.50 to the price of \$32 for the CD Rom. The lady that answered the phone, said to expect a 2-4 week turn around. If you're in a hurry, you might want to call Map Express, at 1-800-627-0039. Their price is \$38 plus \$5 shipping US Mail, or if you're in a real hurry they can Fedex it.

I obtained this info while trying to order a CD Rom for myself. Hope this helps anyone that wants to go this route.

APR REPLY: I would think that the existing APRS maps showing most major highways, would be sufficient. Look at a state highway map to get an idea where the city center is relative to the nearest intersection, and then zoom in using APRS and the cursor to read the exact LAT/LONG.

164. USGS CD ROMS info

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 7 Nov 1995 10:34:44 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951107102533.22248A-100000@greatlakes>
Rendered body type: text/plain

After having told someone to go read the DOCS, I logged off here, and checked what was in my APRS\README\MAPS-CD.txt. This time I called the given phone numbers and played tic-tac-toe on the TTone phone...

But as noted by William Richarz, you can just go straight to the chase by faxing your order and credit card number. Here is my revised info in MAPS-CD.txt.

DETAIL STREETS: Making APRS maps from the 100,000:1 USGS CD ROMS is now EASY! Use KB4XF's MKMAPHK1.EXE and get a copy of the \$32 CD ROM from USGS that covers your area. USGS sells 13 diferent 100K CD's. To see which CD covers your area, hit the 1 KEY on your APRS screen to get to the whole USA map. Then press the MAPS-ALT command to see the CD.map which is under the USA map. This display shows you the areas of the 13 different ROMS. To obtain one of these CD ROMS, send \$32 each plus \$3.50 per order to the USGS Earth Science Info Center, 507 National Center, Reston, VA 22092. BE SURE TO SPECIFY THE Digital Line Graph (DLG) 100,000 OPTIONAL format and the correct ROM for your area. If you want to make bigger, 32 mile maps, then get the 2,000,000 CD that covers the whole US but without small roads and streets.

Useful phone info numbers. But you may as well skip right to the FAX, or mail them a check.

703-648-6045 AND 1-800-USA-MAPS - VoiceMail INFO
1-800-435-7627 - A real HUMAN (and the old fashioned HOLD)
303-202-4693 - FAX will accept credit card orders

To beat the 2 to 4 week delivery times promised by the Government, you can also call MAP Express 1-800-627-0039 and pay \$38 for the ROM plus \$5 handling and get it faster. They will also FEDEX it too...

Another SIG user suggested that I check BBSmsgs. I had to turn it on, and modify INITAEA as well. I just bought the PK-12, and you mention that "older" PK-12's need to have it on, but off is preferred if possible. It's fine now.

Do you think I should contact AEA for an upgrade? The main reason I went with the PK-12 is it's ability to automatically recognize that it is connected to a GPS in standalone mode. Later this week I hope to have a full time standalone tracker active in my car.

166. MacAPRS problem

From: horzepa@gdc.com (Stan Horzepa)
Date: Tue, 7 Nov 1995 11:45:08 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <9511071645.AA14061@mailhost.gdc.com>
Rendered body type: text/plain

I am having a problem with MacAPRS that is driving me nuts. I wonder if anyone here has experienced the same thing and has a solution? The problem is that messages in the message window are truncated at 39 characters.

To test the problem, I sent myself a QUICK BROWN FOX test message last

night and the results were as follows:

The message window displayed the outgoing message as:

the quick brown fox jumped over the lazy dog's back 0123456789

Then, the message window displayed the received message as:

the quick brown fox jumped over the lazy dog's

The return message was truncated at 46 characters rather than 39 characters, but it was still truncated. The only thing that occurs to me is that this may be memory related, that is, truncation occurs when you do not configure MacAPRS for maximum RAM.

Any ideas?

Stan, WA1LOU

P.S. As a side note, I sat down with the topo maps this weekend and calculated my HAAT (it's 481 ft) and reconfigured MacAPRS accordingly. Sorry if my old 980 ft entry caused any drop-outs.

Rendered body type: text/plain

Not knowing what your path was set to, you may have extended beyond 128 characters. I know many VHF TNCs default to a packet length of 128. My Kam+ defaults to 128 on VHF and only 64 on HF. I had to increase both to get full packets sent out. You may want to look into this as a possible solution.

Any ideas?

Stan, WA1LOU

P.S. As a side note, I sat down with the topo maps this weekend and calculated my HAAT (it's 481 ft) and reconfigured MacAPRS accordingly. Sorry if my old 980 ft entry caused any drop-outs.

168. Using ftp'd USGS data question

From: Bob Powers <bob@iagate.guard.state.ia.us>
Date: Tue, 7 Nov 1995 11:35:09 -0600 (CST)
To: aprssig@tapr.org@VM1.NoDak.EDU
Message-ID: <9511071137.aa20272@iagate.guard.state.ia.us>
Rendered body type: text/plain

I have a question on using the USGSMAP1.BAS program to read data ftp'd from USGS. The MAPS-CD.txt says to ftp the data and it will be data with filenames ending in .GRA. I ftp'd to the place mentioned, but after unzipping and un-taring the files I had a BUNCH of files ending in .DDF. I am not sure what to do with these or how to make them work with USGSMAP1. What am I missing

Bob - N0YKX

>anyone here has experienced the same thing and has a solution? The
>problem is that messages in the message window are truncated at
>39 characters.

I saw your test messages last night, and I got them JUST FINE..

The problem is that you have something set wrong in the TNC.. Probably set to a 40 column display or something like that.. Or possibly PACLEN set too short..

I have seen this before, and it was TNC settings problems..

What kind of TNC do you have?

I appreciate your reply, particularly the way you did it.

NOW I would like you to go to your monopoly game and pull out the little house, now place that little game piece in a coffee mug, now place that coffee mug (with the little house in it) into a large mixing bowl. Stand back and take a look...that's what my qth topography looks like, and you say if I can see the rings I should be bale to hit them...I don't think so!

Believe me, after having fought these people in court over antenna, and lost, I am doing the very best that I can....Happy APRSing & 73....Alan, WC7R

171. How do I Upload Map Files to TAPR

From: alanwc7r@primenet.com (Alan Unangst)
Date: Tue, 07 Nov 1995 10:57:57 -0700
To: aprssig@tapr.org
Message-ID: <199511071758.KAA23684@usr6.primenet.com>
Rendered body type: text/plain

I have detail maps of North Central Arizona, that I would like to share with the rest of the APRS fanatics (like me), however, I am new to "cyber Space", and don't know how to do it.

Would someone, who knows how this is done, please help me??

In advance, thank you!

73,

Alan, WC7R

172. Unblock all 1:100K USGS files in a directory at one time

From: Thomas Griffin - x7792 <griff@SSD.intel.com>
Date: Tue, 7 Nov 1995 09:58:36 -0800 (PST)
To: aprssig@tapr.org
Message-ID: <9511071758.AA19318@bungee.SSD.intel.com>
Rendered body type: text/plain

I took Gerry Creager's UNBLOCK.BAS program and modified it to unblock all 1:100K USGS files at one time in a specified directory. The unblocked files are then written to another directory. I named the new program UNBLKALL.BAS and uploaded it to the aprssig upload directory (/tapr/SIG/aprssig/upload) on ftp.tapr.org.

Much thanks to Gerry, N7JXS, who wrote the original program, and John Cavanagh, KB4XF, who provided the fsel() subroutine in MKMAPHK1.BAS which made the new functionality possible.

If you find any problems with UNBLKALL.BAS, please fix them yourself and upload it to ftp.tapr.org.

>

That could account for the problem except that if a message is truncated by PACLEN, the part that is truncated should be transmitted in the next packet. Does MacAPRS discard the truncated portion of the message?

Also, why are messages received from other stations all truncated at 39 characters?

Thanks for your suggestion, but I'm still stumped!

APR REPLY: With the potential for bazillions of maps, the only way to make sense of maps is to distribute them as a package complete with their own MAPLIST.xxx. Follow the steps and guidelines in MAPS.TXT. Here they are again, plus some detail on ZIPPING up your package.

1) Build your maplist with ONLY WORLD, USA, USAWEST, AZstate, plus your additional maps. In otherwords, other than YOUR maps, the only MAPS that should be in the file are the ones that are LARGER and which overlap your new maps.

2) Make a temporary file, say MAPDO, and make a subdirectory within it. COpY all your MAPS into that subdirectroy and copy your MAPLIST.xxx into the MAPDO directory. Then, within MAPDO, ZIP it all up using PKZIP -r-p MYMAPS.ZIP

ThE result will be a distro file called MYMAPS.zip...

There are compelling reasons why NOT to include any maps in your MAPLIST and in your distro that are the responsibility of someone else. Read MAPS.TXT.

## 183. my "MacAPRS problem"

From: horzepa@gdc.com (Stan Horzepa)  
Date: Wed, 8 Nov 1995 08:33:14 -0500 (EST)  
To: aprssig@tapr.org  
Message-ID: <9511081333.AA06023@mailhost.gdc.com>  
Rendered body type: text/plain

I solved my "MacAPRS problem" last night. Keith tipped me off to the solution when he suggested that something in the TNC was set to cause a lower than desired character line length. So, I pulled out the manual last night and, lo and behold, the SCREENLN command was screaming, "Fix me, fix me." How I overlooked SCREENLN before, I'll never know.

Thanks to all for your suggestions,

Stan "older but wiser" Horzepa, WA1LOU... (well, definitely older)

Go by the local airport and find where you can buy a "Sectional" chart. (or a WAC) These charts have grid lines for checking coordinates, and they're pretty good for doing rough checks. We use them, now, in the lab when we're going out to do a survey job somewhere in the boonies. Do our planning by looking at the Sectional, grab the monuments list and check what's local to that, and then go do the survey.

Someone on the SIG posted a message, sometime ago, that mentioned a small printed circuit board that fit inside a DB-9 shell that I thought was similar to the HSP/SPM circuit described by WB4APR in the docs.

It was available from FAR Circuits in Dundee IL at a cost of \$3 + \$1.50 shipping. I sent for and received one. It is not what I expected as it looks like it only holds a couple of diodes and some resistors. The circuit I was expecting had a bunch of diodes, some resistors, capacitors, and a couple of 2N2222's. APRS controlled the switching between the GPS receiver and the TNC. I was going to build this and thought the pc board would make it neater than a soldered glob on vector board!

Would the person who originally posted the info please describe what this pc board does... \$4.50 won't break my bank (grin), but I just want to know what I bought!

THanks so much for reading this... sorry for the bandwidth!

186. Coordenance

From: ke4eer@ro.com (William Nolle)
Date: Wed, 08 Nov 1995 08:41:23
To: aprssig@tapr.org
Message-ID: <199511081547.JAA12735@sh1.ro.com>
Rendered body type: text/plain

Gerry,Bob and others, my message must not have made it to the sig. I found the information at Tigers on the net about finding the exact coordiance of a city or town. Boy sure makes things a lot easier. Now all i do is enter that info and it's always right on Target. Looking at some of the current maps with APRS just doesn't cut it because they are off by as much as 3 or 4 miles, so if your making 1-10 mile maps that doesn't help at all. Now i have a list off all city's within my state. The list is available and covers all of the US, it's big @.

<http://tiger.census.gov/places.html>

I now have 141 detailed street level maps for Alabama and users are asking for more. By the way the places list has much more information in it then just Lat/Lon but the last two colums are the coordiance, and if your like me and those figures don't make much sence Bob set me straight on how to convert them to APRS standards. There maybe a figure like 33.123456 to convert this take the figure after the period and multiply it by 60 so in this case it would

be .123456 X 60 = 7.40736 result = 33,7.40736 I figured i would explain this for those users that are like me and get lost walking around the block.

Bill KE4EER

William,

Tell MKMAP.EXE to use 32,30.0328 and 87,50.5902 for the center of the map.

I converted them to base 60 by multiplying the decimal degrees by 60.

Hope this helps.

Message-ID: <199511081516.KAA11148@po_box.cig.mot.com>
Rendered body type: text/plain

Stan, I played with the settings last night and concluded that the "screenl" parameter was the problem...but you beat me to it!

A related problem is that the MacAPRS message window size will only hold a little over 50 message characters, although I find that message lines are frequently much longer. There are no side-scroll bars on the message window, so it is not possible to see the final characters on many messages. This is NOT a "screenl" problem, as I can set "screenl" to 132, and am still unable to view complete messages.

The only way around this that I have found is to use a text editor to examine the APRS log file, which does contain the full text. Not a very elegant solution, though.

Any ideas???

189. Newton and GPS

From: Don Froula <froula@cig.mot.com>
Date: Wed, 8 Nov 1995 09:19:25 -0600
To: aprssig@tapr.org
Message-ID: <199511081527.KAA11816@po_box.cig.mot.com>
Rendered body type: text/plain

I was looking for a way to monitor the NMEA output of my Motorola OEM board-based tracker to see if my QST patch antenna was working well enough to lock. I thought of using my Newton as a monitor. However, decoding the NMEA sentences while driving and squinting at the tiny screen was definitely a safety hazard! I scanned the Newton archive sites and spotted an application called GPS Button. It provides a floating "GPS" button that expands to a full status window containing LAT/LON, UTC, and sat status. In addition, it allows one to log the current position by selecting an insertion point in the Notepad and hitting a button. When connected, the Newton clicks until three sats are acquired, when the sound changes to a sonar-type of "ping".

The only catch is that the program (shareware) only works with a Trimble unit with the output port set to "Newton" mode. Some investigation proved that the Trimble "Newton" mode was merely standard NMEA GGA and VTG sentences sent at 9600 baud, rather than the conventional 4800 baud NMEA rate.

An hour or so with a Mac file editor and a Newton debugger yielded a patched version that works with any standard 4800 baud NMEA GPS unit. The "ping" is ideal for determining GPS lock without taking my eyes off of the road.

Please contact me at froula@cig.mot.com for information on the patching technique.

With all of the messages floating around about making maps to fill the hard drive, I wonder if someone in the future could develop a routine where APRS could read the USGS cd-rom direct and put the desired map on the screen. Just a wild thought. Probably be a programming nightmare. It would save the harddrive for other things though hi hi.

I THINK NOT... The method in which the maps are made SIGNIFICANTLY reduces the amount of points in the maps, to under 3000 points for the DOS version.

A typical file from the 1:100K files will produce 50,000 -> 100,000 points if there is no data reduction. On a the Mac, I can make one of these files in about 10 seconds AFTER reading the file in from CD, however, I can display it MUCH quicker if it is pre-processed.. To do it this quick, I read in the ENTIRE PK-ZIP file, UN-ZIP it in memory, processes it all in memory.... PK-UNZIP the file from disk it takes MUCH longer..

Also, the amount of text in these files that is just blanks and un-used data is very high..

What we ARE doing is to produce a CD-ROM with APRS Maps on it. The announcement about this went out a week or so ago..

We will be collecting ALL of the PC maps we can get our hands on, and also producing significant amounts of maps for MacAPRS/WinAPRS. (They are the same maps, no difference between the two) We expect to fill a 600meg CD with mostly maps.. It will of course have the latest versions of the software and any other related/useful programs. This will be released at Dayton 1996, and will contain the OFFICIAL RELEASE of WinAPRS.

If you are doing one or two cities, this will work, but if you are
into a lot of maps, for the price of about 3-4 sectionals you can get
DeLorme's Street Atlas. It will give you Lat-Long, optionally.
Besides, you'll have it for other uses. As some have said, it isn't
very up-to-date, but 99% of the roads (or more) I'm interested in
haven't moved since it was pressed.

You got that right! When I registered my version of STSPLUS, I gave him a lat/long I got from the FAA Airport/Facility Directory for the local airport. Others may have used better or worse information.

Anyone interested in the satellites or Shuttle or orbital mechanics in general should check it out. Dave Ransom's BBS # is 1-310-541-7299. Caution: because of the the graphics demand, and the computations done, a FAST computer with a math coprocessor and VGA or better is required for acceptable results. Slower computers (8088 or 286) won't do too well, I'm afraid.

This program may really be nice when Bob gets the APRSSAT "launched". Put in the "KEPS" and you'll be able to see it as it comes by your location.

Candian Maps...

I have some high-res data for Canada, and will be working on getting maps made from it between now and Christmas...

These maps will work with MacAPRS/WinAPRS to begin with, and I should be able to make PC maps sometime after that..

If you are in big hurry, send me personal email and we can discuss it..

For Windoze users, WISP is another great tracker. It was built primarily to automate packsat operation and includes many features for auto upload and download from them. It also has the ability to launch a user-specified program just prior to satellite acquisition, meaning that you could let all of it run in background and have WISP launch APRS or WinAPRS just in time for the APRSsat pass!

SOMEone said that APRS would not decode their U-II whcih was outputting a 40 character data stream instead of a 14 character data stream. I call Peet Bros, and they confirm that there is a mode that you can get the U-II into that will output a 40 charactre data report, but that it is for factory testing only, and shuld not be used.

If YOUR U-II got into that 40 character data mode, then you have to do a cold reset by removing the 9 volt battery and power. If you are doing a keyboard sequence that is putting you into that mode. THEN dont do it, hi hi...

>Can you use Delorme Street Atlas with (Mac)APRS?

Sort-of..

We have the ability to load in PICT maps, this was announced awhile back, and you can save PICT (Screen dumps) from Delorme, then you have to manually add the lat/lon boundaries to the file..

This manual addition is what is the current hold-up.. When I get that made easier, this should work pretty well..

We showed this a little bit at the ARRL Digital Communications Conference in Dallas TX in September..

Delorme's data itself is fully protected by encryption/whatever, and they aren't interested in giving that information out.. So we cannot use the data on the CD itself..

I apologize for the use of the bandwidth but since I don't have access to the NEWGROUPS and this is the group most likely to be interested anyway...

4-sale;
New MFJ data radio (packet only, not voice) 1200 or 9600 baud.
Crystals for 145.01 & 145.79 included (rig uses only
one set of frequencies at a time and must be trimmed for
frequency in use) Never been on the air. Plans changed and
no longer need. First \$105 offer gets cash-only COD shipment
in continental USA. Please reply *ONLY* in private email and
NOT to the SIG.

<n8mwz@amsat.org> (preferred) or
N8MWZ @ KB8GNF.#NW0H.OH.USA or

The U-II outputs 14 ascii HEX characters. BUT you need a -v pull down resistor if you are going to look at it with a scope or hook it to a serial port... The Hex values are wind speed and direction, temperature and then two 4 hex byte rain counters...

Is there a problem with the subscription list at APRSSIG ? I fell off the list last week, re-subscribed and got two day's sigs, then it appears that I am off the list again. Probably won't see the answer unless it slips in on one of the days that I ON the list. hi Gordy WB6OVH.... ..

This may only sound partially beneficial, but it will be TREMENDOUS when it is fully implemented. Imagine, being able to just use StreetAtlas to select the map you need for a special event, save it as a PICT file, add the necessary lat/lon boundary info, and away you go with fairly high detail (read "pretty") maps especially great for showing the public what we can do (also great for showing street level detail without exceeding point limits).

I am excited about getting my hands on that (let me know if you need a beta tester Keith, hihi).

This may sound like a foolish question...What exactly is APRS? I have been in to packet for the past three years, but have no idea what this 'new mode???' is, how it works, or how to get involved with it. I live in Downey, just south of Los Angeles and would really like some info, or a suggestion on where to get more info.
Thanks...Larry, kd6nzw

213. APRS via Voice Repeaters... Anyone done it yet?

From: n2czf@gate.net
Date: Thu, 9 Nov 1995 23:02:21 -0500
To: aprssig@tapr.org
Message-ID: <199511100402.XAA10705@tequesta.gate.net>
Rendered body type: text/plain

Well I have finally put together my UHF repeater after a few months of gathering equipment. I would like to hear from anyone who has actually set up their repeater for APRS operations with a TNC "on-board". I have already done the packets thru the repeater in conventional mode but now it is time for something diffent!

I have thought of a TNC with a regenerative board installed at the site and also of a TNC with it's RX connected to the 440 RPT and TX on 145.79 so that I can TX from the car locally to the rprr (poor coverage in my home area with our WIDE) and still have everyone on VHF see me. A mag mount on the repeater inside of the building (220ft) with 5W should make the digi with no problems. If I go this way I guess the smart thing to do would be to also connect the 145.79 audio to the TNC so DCD operation can be maintained (to avoid collisions) but I DO NOT want .79 transmissions repeated over my 440 repeater.

Any ideas so I do not need to re-invent the wheel ???

Date: Thu, 9 Nov 1995 23:14:17 -0500
To: aprssig@tapr.org
Message-ID: <199511100414.XAA53626@tequesta.gate.net>
Rendered body type: text/plain

Just received word on my message screen that Carl KA4OPZ will be leaving South Florida for Boston at 10:30am EST on Friday the 10th as KA4OPZ-7.

Keep an eye out for him, and if you have a GATE in your area and he is not going via a UNPROTO with GATE in it please UPLINK him for everyone else to see. I am not sure on his route (little notice) or what he will use as a radio but I do know that he does have a KPC-3 so he may have various strings for his data including WIDE,WIDE,WIDE RELAY,WIDE,WIDE and hopefully something with GATE in it.

I am also not sure if he will have a PC with him or not so do not be surprised if he does not ACK your messages, I do not even know if he will have a co-pilot. This is a private plane, no fancy jet so if he does come thru your area he should be in range for a while at that speed.

I will update this information if I receive any more from the guys "down south".

Hi Boyd,
Thats the layout as described in GPS.TXT in the APRS docs. If you look at
the diagram for Bob's layout, not the PacCom, you will see where the
components go.
It has the pinouts for the xsisters and other stuff and remember since it
was built to go inside of a DB9 use both sides of it for installing parts.
If you need a hand or have a question get back to me.

To: aprssig@tapr.org
Message-ID: <199511110402.XAA32380@tequesta.gate.net>
Rendered body type: text/plain

I have read in the past week or so that the USGS was limiting some of the DLG file support available via Internet. I had some time on my hands and decided to give getting a file a try for my area and found that I could access NOTHING!

Are there just some server problems or have others had the same problem?? I tried to FTP, I tried to DL via the WWW page but no luck. I get via the web the file is no longer available and via FTP I get no access except for a message that they are under changes and try on Monday. Does any one else have further information? Gerry....??

Please try to respond directly, I have only seen 2 sig messages in the past 2 days and have tried to fix the problem. I got dropped for no reason and then found that I was still showing as subscribed, but no mail was received. I unsubscribed and re-subscribed and got a couple of messages. It has now been 4-5 hours and I have seen no mail, very unusual so I am guessing there is mail but I am just not receiving it. I have just about given up with the listproc since I am spending more time "fixing" than reading mail!

220. 100K map sizes

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 10 Nov 1995 23:38:46 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951110233005.9255A-100000@greatlakes>
Rendered body type: text/plain

As an independent data point, I just digitized a map of Maracaibo Venezuela and found that I could not make a map bigger than about 1.5 mile range and stay within the 3K number of points.

This sounds like the same number of points that people are getting from the MKMAPHK program from the CD ROM for a similar high density area.

This is good news to me. It means that the MKMAPHK program is drawing the map without WASTING a lot of points. When I use a digitizer, I am making the map about as effeciently as you can get, as far as conservation of the number of points used...

So, GO FOR IT! Start cranking out those 100K maps...

I am, I am Bob since the MKMAPHK came out i have made well over 140 maps i just send you a disk with ALMAPS01.ZIP but already have a ALRAFT01.ZIP so yes the program does do a good job of keeping a map right at the 3000

point mark it will either be very close or may go over just a little but can always be trimmed to get it down. Right now i'm at 157 maps. By the way the City and Town coordince list is working great, saving a lot of time!. So guys go at it there's no reason not to have good maps now, but man do they start growing and taking lot's of space, my 157 maps take over 3 meg unzipped.

Go all you mapmakers, Alabama is getting pretty well covered Hi

Since I loaned out my only 100K CD to KE4XF to write MKMAPHK, I havnet been able to test it, but today I got a disk in the mail from KE4EER who

has prepared a 150 map distro for ALABAMA. It LOOKS fantastic!

For Birmingham, he gridded the city into 2 minute grids. Then used MKMAPHK to make 1 mile maps. Then listed those maps in MAPLIST with a 1.1 mile range so they will pop up at the 1 mile range reliably. He found that asking for 1 mile maps brought the number of points in at about 2950 points or less every time.

On some of his maps, I ran MAPFIX alt-SCRUNCH with a slope of 1.2 and removed about 200 points per map... DO NOT RUN ANYTHING BIGGER than 1.2. 1.3 only picked up about 5 additional, and 1.4 only got a few more too. NOT worth it.

Of Bills hundreds of maps, probably only 10% of them were right at the 3000 point limit, MOST of them were somewhat less, depending on the neighborhood.

This makes me want to suggest that you still make maps on a 2 MINUTE grid, but ask MKMAPHK to MAKE 1.1 or even 1.2 mile range maps. (I assume that it will make maps of a fractional range). This will give the maps a little bit of overlap and MOST of the maps will still be below 2999 points. For those few that are too many points, re-do them at 1 mile..

This is fantastic. APRS can now DO IT, ANYWHERE IN THE USA!

THanks to Bill and to Jack Cavanaugh who wrote MKMAPHK!

CAMAPS04.zip has been uploaded to FTP TAPR.ORG in the TAPR/SIG/APRS/UPLOADS directory.

This update includes some 1 mile neighborhood maps in the San Francisco area plus some larger scale maps of areas in Northern California previously not covered well.

Copy CAMAPS04.zip into your toplevel APRS directory then use the PKUNZIP -d command to unzip it. This will place the new MAPLIST.CA into the APRS directory and the maps into the \MAPS subdirectory.

Since this is my first FTP try, will the first person who successfully downloads and unzips CAMAPS04.zip from TAPR, please let me know!

Thanks for the report Bob. Just thinking of a problem that developed this morning when adding Phenix Alabama to my maplist. There's a limmit of 159 maps if i'm not mistaken. Is this for individual state maplists also. Because this morning i reached that lmmiit and on my first try it gave me an error message that i had reached that limmit yet i have 166 maps now and the second time i ran APRS74 it worked without a hitch. This may be a problem tough since i'm still planning to add additional maps Hi. Ok Bob i will take your advice and see what i can do with it. I just completed ALAFTR01.ZIP with actually 177 maps in it. I would like to see MKMAPSHK not crash if you attempt to make a map using -6 or -8 because that map could be trimmed or scrunched. It does have a few bugs but all in all it works great.

> Is the 3000 point limit a limitation of Qbasic or a memory concern or what?
> Curious minds want to know...

APRS keeps the LAST 4 maps in RAM. this means 4 x 3000 points.

That approaches a full system memory wise...

I could go to fewer maps in memory, but then it would take longer to jump around while waiting for disk loads. More points on a screen are just too busy to be of much value. As you ZOOM in, and want more detail, then you can always have a smaller map..

So the answer is that it is arbitrary. But no matter what limit I set, we will all want more, hi hi...

Remember, I want APRS to run on an 8088 with 640K. In that case 3000 is the maximum...

I have read the messages about making maps with MKMAPHK1. I gave it a try by downloading some DLG maps from the usgs, using UNBLOCK as noted and then running MKHAPHK1. I get the message Oops none of the maps ... have data points within (the radius I set).

OK can someone advise me as what I am doing stupidly. Maybe I can not use the downloaded DLG maps from usgs (yes I set the ftp to bin before downloading them). Am I using UNBLOCK incorrectly? Seems to be pretty fool proof (of course I must be a fool to send this message out). Did I do something incorrectly when I gave MKMAPHK1 its input? The directory was correctly inputted (I did this about 50 times over the last week or so). I think I got the correct lat/lon. Actually I used the lat/longs in the maps. Is this not correct? I tried all kinds of radii, both + and 1. From less than 1 to over 16 (found out that is the limit).

I want to make some maps so I can contribute to the effort. Would someone reply in private with suggestions on what I am doing wrong.

Thats enough bandwidth usage for me.

I have just successfully uploaded my ALMAPS03.ZIP onto the tapr system it's in the /tapr/SIG/aprssig/upload/backups/ directory. It didn't allow me to upload in the upload directory i guess it takes a password.?. If your interested in downloading this file make sure you also get the README.ALA there are 173 maps in this new distro and the file is 981.480K. I took Bobs suggestion and scrunched all the maps at 1.2, it did save some points and made the total filesize a little less also. This was my first FTP upload. Let me know what you think of the way Alabama is mapped.

Well disregard the message on where to look for the Alabama maps. I finally figured out how to do this FTP thing right hi. The file ALMAPS03.ZIP and the README.ALA are both in the regular UPLOAD directory with all the rest of the APRS files. The only thing i can't figure out why it gave a Sunday 1994 upload when in fact it's Monday 1995, and no it's not my system clock cause i set it daily via the atomic clock in Washington i think it is. In any case the file is their for you to download if you wish. The file has 173 detailed maps fo Alabama, included are a couple for Nashville,TN and a couple for Amory and Tupelo,MS. This the latest maps i have done from CD-Rom. These where all made using both MKMAPKH.EXE and MAPFIX16.EXE Thanks Bob and Jack for the software, it sures makes it a pleasure to make maps now.

Sam,

I'm sending this to the rest of the group so we can all learn.

I see no mention of decompressing the files you downloaded from USGS. Are you using GZIP -d to decompress the GZ files? All those DLG files have been compressed with GNU Zip. GZIP can be found on the TAPR FTP server in the APRS SIG UPLOAD dir.

Hope this helps!

Good work on the maps, Bill!

Now, Bill, your next mission should you choose to accept it, is to write a FAQ file with *complete* details about how to create maps. Bits and pieces of the procedure have been discussed in past threads but it would really help to have it condensed into one file. How about it Bill? PleasePleasePleasePleasePlease!

Rick, thanks for the reply. Yes I did use GZIP -d to decompress. I followed the directions as outlined in previous posts here. I have not successfully created a map todote. I think the DLG's on usgs are not the same as on the CD-ROM or the method of extraction changes. Perhaps someone who has done this successfully can give the steps again with some detail.

BTW I use the DLG's from the boundaries directory. This may not be correct. Could be one of the problems. I will try DLG's from the three other areas over this week.

I am not sure about the lat / lon. I find that my DLG's define a lat lon within the file itself (its a text file). I have used the center of those four lat lon.

Let me know what you find out.

Make sure you download the .opt.gz files. That's a real "gotcha" if you're
not unix-friendly. When I download them, I do a name change so that

AU2_RDF_03.opt.gz becomes
au2rdf03.gz

and unzip them from there. Unblock will then turn them into appropriate
files.

 Rendered body type: text/plain

Just seen a message from Gerry to make sure you download the OPT format only. Although i have the CD-Rom i received several messages this morning on the procedure for making maps from the USGS system. Well i downloaded a file (In the OPT format) and then unzipped the file using gzip wich by the way would not run on my system till i disabled EMM. I then unblocked the file. I picked Downtown Huntsville,AL and made a 1 mile map. Worked great. The map came out just under 3000 points and when Scrunched at 1.2 came down to around 2750. So it does work if you pick the right files. And by the way USGS is back online. If more help is needed drop me a line. And yes guys i will make a complete FAQ file and post it for those that asked me to do so with all the messages i got thsi morning. Great to see all the interest in making detailed maps for your states.

 Rendered body type: text/plain

Well i will do the best i can at telling you how i make the 100K maps from my CD-Rom. Actually it's the same for the USGS files except there are a couple of more steps (Unzipping and Unblocking) with those files. I will use TROY Alabama as an example since that's the one i just added to my list of maps.

I suggest you download a file i mentioned before name PLACES.ZIP from Tiger at.. <http://tiger.census.gov/places.html>
 It gives all the City and Town coordinances for the USA.

Ok i did that and of course the way they show the data is in a form not suitable for APRS use so therefore, i ran into this problem and Bob helped me out on that. TROY,AL shows on the list as +34598597 -087089825 discount the +/- since all that tells you is East or West i believe. Now take the last 6 digits and multiply it by 60 (Example) .598597 = 35.91582 then ad the 34 giving you 34,35.91582 \, do the same for both Lon and Lat. This will give you the exact center of Troy,AL (Rest assured it does) that's what makes this file so great to have. Now it's time to start making the map. First AGAIN make sure that you have a directory with only the CD-Rom files in that directory or your system may crash. Start MKMAPHK.exe and when asked enter the path to the CD files (I used E:\TROY

Now the software will aske the mapname you want to create (Don't add the MAP extension) the software will do this. As an example i always use ALTROY in this case for the main less detailed map. Hit return and the program will ask for the coordinance. Enter 31,48.24708 (Hit return)

Now enter 85,58.08978 (Hit return) Don't forget (it's a comma after the first two digits NOT a period like in the second figuer). The reason i tell you this i have made this mistake many times. Now the program will ask what detail you want in your map, for the TROY less detailed map i selected -5 this depends a whole lot on the town size. for a small town you may get away with doing a -10 but no more then that or the program will crash anyway. Anyway i chose -5 the Minus is to indicate less detail. Now hit return and your map will be build right before you eyes. Now in many cases after it's done and you hit the return key like you map will look a mess and the roads are totally scrambled. Don't dispair this happens when there's to much data in the map. just hit return again and do this. The program will have produced 3 files.

- 1) called TROY.MAP
- 2) called TROY.DAT
- 3) called TEMP.DAT

Delete the file named TROY.MAP (Go ahead it's no good anyway)

Rename the file TROY.DAT to TROY.MAP, now start Mapfix16.exe or one of the other versions. Bring in TROY.MAP and in many many cases it's still below the 3000 point mark, but if not just do a scrunch at 1.2 to bring the points down. If after this there are still to many point's which i doubt then you will have to do a ALT-T and trim the map. Also i have to warn you many times when you pick a map to large for MKMAPHK it will crash. Also in 100% of the time using MKMAPHK it will give an error message when the map is completed wether the map is good or bad just disregard that message!. Now

that you have made a couple of great looking maps you need to check the center coordiance of the maps by using a text editor and you will see looking down 5 or 6 lines a couple of figures (In this case for the TROY.MAP it is

31.8041
85.9682
5

These are the figures you must enter into you MAPLIST.XX in the following format

ALTROY.MAP,31.8041,85.9682,5. Test ay follow here.

The 5 on the end is of course the range, i normally would make that number 5.1 to make sure the map comes up when zoomed in on it.

I hope this will answer most of the questions on making detailed maps using the MKMAPHK.EXE and Bob's MAPFIX16>EXE if i missed something i'm sorry but a writer i'm not, but am willing to help and answer anything else i may have missed. Happy mapmaking APRS users and let's see if we can cover the USA with detailed maps HI HI. I am well on the way here in Alabama.

Rendered body type: text/plain

Hi guys, i better make another installment on the mapmaking FAQ file. You know it's bad when you get old and start forgetting thigs Hi.

I forgot to explain on the finer Smaller more detailed maps that came after the ALTROY.MAP. Well here it goes, In this case i called the smaller map ALTROY2.MAP, this way i know when palcing them in the MAPLIST.XX i know that the ALTRO2.MAP goes after the larger ALTROY.MAP.

To make the more detailed center of town map, use the same coordiance as you did for the ALTROY.MAP and follow the same rules exept when you get to the point where MKMAKHK.EXE asks you for the amount of detail you want. In a few cases i have done maps 3 levels deep, in that case the second map you will not use a Minus or Plus sign in front of the range. Lets say your going to make a -10 range map you may want to make another at 6 or 4 then enter 6 or 4 only. Then when you get down to the smaller maps you will be using the +1 or +1.5 I have found that it's not much use trying to make a very detailed map over about +1.5 in fact in most cases only the +1 detail level will work. In a City the size of Birmingham,AL you will notice i did the whole City with +1 only. The way i did that one was to make a larger -10 or so then used MAPFIX16.EXE and drew i gridwork over the map and saved it as MAPGRID.MAP. The way i do this is to use the RANGE ALT-R and make the range of the white square that size, i use tgis to draw the gridwork on the map. Then after the gridwork is drawn i moce around the white range square to tell me the coordiance of the top grid of each box drawn, then i do the same for the vertical row, in this way it will give me the coordiance for all squares in the whole grid and i don't have to mark down those figures for each map. This will also give you a good idea of how many maps it's going to take to do that City. Doing these smaller 1 mile maps you will find that in some cases the software (MKMAPHK.EXE will still scramble the map and make a mess out of it, but in alsmost ALL cases when you delete that map file and rename the .DAT file that it will already be under the 3000 point mark. In most all cases if you do a +1 you will always come out with a good map. Even at

this as Bob suggested still do a Scrunch at 1.2 (No more then 1.2)
I hope this will give you the rest of the process Hi. If i didn't make myself clear on drawing the grid over a copy of the first map and how i get the coordinance for the whole griid from that let me know and i will try to clarify the process i use.

Well Paul that's where the EGO digi comes into play. We have a digi with a PHG that the circle just toughes my QTH and i should be able to hit him with an HT, but in reality i have attempted to hit is with 300+ watts and stacked 13B2's and still could not hit that digi, so this tells me that not all digi's are craeted equil. Now maybe it's just bad out my way but that's rather hard to believe so at times Yes i use power to get to the person or digi i need to get to. How else do you suggest this would be done?.

Those of you who have had trouble ftp'ing 100K DLG files recently may be interested in this email response I received from usgs...

Doug
KC7CO

----->

Hi Doug,

>I was disappointed to see the 100K DLG data missing from the edcftp
>server.
We're having problems with our file server right now, but the server should be up and operational soon. We are also transferring the 100K data to a more stable (and faster) system, and this may have an impact on file access over the next week or two. Please try loading the files again at a later time.

We're sorry for the inconvenience. Hopefully we can have all the system problems resolved soon.

Thanks for your patience!

Can someone direct me to the node program X1J4. I understand that it works well with APRS. Comments on X1J4 would be appreciated.

----- REPLY, Original message follows -----

What you get is an "alligator", all mouth and no ears. It will not hear the low power suburban stations and will thus transmit when they are transmitting, thus causing excessive collisions.

Paul
WD9ABE

----- REPLY, End of original message -----

I just found out that there's a STRONG tone carrier at 152.870MHz close by that's really messing up my receiver. That, plus the fact that at the last Northern IL APRS Net meeting we discussed the problem of not being able to hear much (most of those guys are in Chicago) led me to believe that part of our problem is receiver desensitization. So I called AES today to see what they have for intermod/bandpass filters. If that works pretty well, I'll report back.

As far as power goes I feel that testing and LOCAL experience is the only way to make a good decision. I also feel that what was once a good power level may need to be thought about again as the local WIDE area covered changes due to new WIDE's.

When an area has only 1 WIDE in range of ANYTHING the conservative power level can be a bit more lax than when you have multiple WIDE's that may overlap each other. We can probably never have utopia with WIDE digi's since we will probably never have access to a good site EXACTLY where one is needed so overlap may happen. In this case let's try to be a bit conservative and experiment.

One case that comes to mind is the Orlando Florida area where there are no "official" WIDE's yet. They have a 200ft location and are waiting for crystals but once that is up there are no other digi's within reasonable range to link up with. In this case they could probably start with a higher power level than normal and experiment. Once the system develops and more WIDE's are built in range of Orlando the power level will need to be turned down so that the system can be efficient. In the meantime a high power level will not hurt anyone in that area and give those locals a better chance to link with WIDE's 100 miles away to the West and South East when there is a slight opening, keeping their interest alive. As more and more users come on line there will be better input locally as

to weather the power level used is necessary or if it needs turning down.

The answer to everything is use your brain and nothing is carved in stone, try different approaches and change things as necessary!

That likely is your problem. None of the map tools available will extract data for boundaries, public lands, or misc. transportation. Mkmaphk1 will not extract stream data either. It has to be brought in from convl00c which takes a very long time. I don't know yet if mkmaphk1 will extract class 9 and 10 roads but I need these for search and rescue maps for parks and National forests along with the streams.

Could someone who knows the mkmaphk1 program and that has the full version of qbasic please make the following mods.

1. Include a menu to choose all or any combination of data types from All the DLG files.
2. Provide a user defined scrunch ratio as in mapfix. 1.1 default?
3. A "do another map" question at the end of the program that saves the DLG path information. I get real tired of typing the path in for each map.

On another note, beware of mkmaphk1 dropping features during the chaining process. It has done this to me several times including dropping an entire coastline. Check very carefully that all the grey lines have been converted to white after the chaining is completed. Any lines that are still grey will be dropped from the map.

I have seen no indication that it will, but if you use convl00d (I'll make it available sometime tomorrow) it will do a one-step UNBLOCK and CONV process fairly painlessly. Then, you can grab the class 9 & 10 roads into an independent map, and then edit the MKMAPHK1 outputted map and import them. That process adds little time and effort to the entire map-maping process, and

if you really need those roads, it insures you get them.

> Could someone who knows the mkmapkh1 program and that has the full version

Unfortunately, this won't be me. I've got my hands full trying to get my cows back in the field, so I'm out of commission on other projects right now. I'm shooting for the Christmas holidays for some coding and some new releases, though.

> 2. Provide a user defined scrunch ratio as in mapfix. 1.1 default?

This would be nice.

It also takes some liberties with connecting roads at intersections, I've noted. So, I have a very nice road coming straight south, and when mkmapkh1 comes to an intersection in the chaining process, it doesn't take the (visually) logical step of chaining it to the continuation. Nope, it chains and makes the object attached to an east-running or west-running road!

> Well Paul that's where the EGO digi comes into play. We have a digi with a
> PHG that the circle just toughes my QTH and i should be able to hit him with
> an HT, but in reality i have attempted to hit is with 300+ watts and stacked

That theory works if the circle drawn takes into account terrain and HAAT at both ends of the path. APRS doesn't! We have to use our heads about propagation and terrain for the area and direction we are working for the circle to mean anything.

I have used RF engineering software designed to provide this info in graphical map style printouts. It takes time to input all the data and HOURS for the computer to crunch out all the data and draw the map. Still yet these maps DON'T show dead spots (holes) in the coverage. What is shown are the outer limits of the pattern and from that you can sometimes figure out which mountain (obstruction) is in the way. Bear in mind one of the parameters you have to input is RX ANTENNA HAAT and SIG strength desired at the outer most limits. APRS can't do that AND ITS not fair nor practical to expect it to. What it does give us is a ROUGH GUESS of coverage ON FLAT TERRAIN (this comes from observation). Now Bob has suggested that we skew the inputted data so that the ring is close to correct, by changing HAAT, PWR, ANT Gain, and Coverage Angles. This works great on flat LAND. Here in the hills THERE ARE TO MANY OTHER HILLS for this to even be practical. Case of point. I have access to a site that is +2500 feet HAAT (4100 feet at base of tower, and I am in East TN.) However contrary to what the rings would show this site WILL NOT WORK North Georgia Because there are 3,000 foot mountains between us. (It can work the Stone Mtn Georgia though.) However to draw the ring to correctly show it coverage APRS would have to compensate for about 20 offsets in the antenna pattern. Therefor skewing of data is not acceptable. WE HAVE TO THINK...hihi.

> 13B2's and still could not hit that digi, so this tells me that not all digi's are
> created equal. Now maybe it's just bad out my way but that's rather hard to
> believe so at times Yes i use power to get to the person or digi i need to get
> to. How else do you suggest this would be done?.

Bill I agree, you have to use the amount of power necessary to make the Haul. When I first read BOB'S opinion that ALL wides only run 10 watts I almost fell out of my chair laughing. (No offense intended towards Bob.) Then I took into account that terrain Bob was working with. 10 Watts maybe fine THERE.

First CAN SOMEONE define for me IN MILE RANGE OF COVERAGE that a WIDE should be??

My opinion is that if The node Can not make a 50 - 90 mile jump to the next node that it IS NOT A WIDE. It is only a local node. AH, more problems here, welcome to what the PACKET Network Managers have been dealing with for years.....hihi

Bill your words were never truer, "NOT ALL DIGI'S ARE CREATED EQUAL." FOLKS in all probability we have TO MANY WIDES and not enough LOCAL nodes, so we live with 15 echoes from a beacon of WIDE, WIDE. Now I am not espousing that the Local digis' run Relay instead of WIDE, Then we create the same monster only worse, and by a different name.

Recently Bob asked for suggestions about using 4 alias's on a node. Bob, you shot down some of my idea justly. Maybe We have looked at this the wrong direction. Maybe instead of more alias's on each node, we need fewer nodes with the same alias. In other words define a minimum range that a wide should cover. And maybe add a third universal alias, other than WIDE or RELAY, for the local nodes that cannot make the long hauls. There are problems with this idea, namely not everybody can hear the wides and there for would be left out. Well not everybody can get into the high profile repeaters either.

Let me give one parting word. The APRS digi I sysop is at 1200+ feet HAAT and is running 40 watts into a 6 Db Antenna. The 2 closest digis' are 57 and 90 miles away in different directions. Yet we see digipeats and keyboard some from Knoxville TN to Atlanta GA, using only Callsign, wide,wide. Now I can't say that what is seen in Atlanta but we only see one echo from the second wide here in Knoxville. Oh that is probably a 180 mile hop Due to going via A digi in Chattanooga. But then some maybe right, I should drop down to 5 - 10 watts on the digi, and only talk to ourselves locally. Or drop power and add several more digis between here and there, and see 30 echoes of every beacon sent because it has to be sent wide, wide, wide, wide, wide.

hi hi hi

Folks by now everyone should Know what works in there own little corner of the world as far as propagation goes. I can and have helped build a working packet network that runs from Memphis to Bristol TN (600+ miles). But I am not the final authority on what works and what doesn't work in a network. You have to do your own homework and think it thru. Believe me what works in one place may or maynot work in another due to terrain, or just plain politics.

Yep Bill not all digi's are created equal.

>

> >power??? What are peoples thoughts?
> >
> >Paul, WD9ABE

Yep, Paul you are confused. At 5 watts the system will stay balanced and with luck you may be seen 35 miles away. PLEASE DEFINE EXCESSIVE.....Back when the FCC licensed Ham repeaters anything over 25 watts WITH A HAAT of +2,000 FEET was excessive. Most below that HAAT ran 100 Watts. Using that as a base line maybe I need to change 40 watts to 100 watts.....GRIN..... But then again I don't think so.

I've been reading through the discussion about who should run what levels of power and from where and it's interesting to see various opinions on what's good, better and lousey. Here's mine:

When in Digi and Repeater land, power is good; More is better, especially when coupled with HAAT's above 0'. I've been doing repeaters and remote bases in So. Cal for 20 years and if you REALLY pay attention to your receiver; get a good front end on it (i.e. sharp cavities to keep out all the 1/2Kw paging xmtrs and various other nasty noise generators), properly shield the radio against building interior RF noise, etc. it's amazing what can be heard.

All of my UHF radios out here run a min. of 100W into 10db stationmasters. The receivers are running Gas-Fet preamps with noise floors less than 1db with cavities into the preamp and between the preamp and receiver. The result is a really loud radio with ERP's approaching 1000 Watts and they are reciprocal with H.T.'s of 1-3 watts. Had a L.A. TV Network call me a few months back wanting to know why our ham stuff worked so good and the system that they paid some "consultant" almost \$1000,000.00 (yep, 3 0's) to screw their's up didn't.

Moral of this story: If your gona make a WIDE, . . make a W I D E ! Just pay attention to 'good engineering practices', build it right, install it right, do your field checks, THEN set the power knob to what works.

In this area I don't think it's a big deal for WIDES & RELAYS to run 100Watt radios. That's what's needed to get in, around, & out of the valley and canyon areas that make up this side of the U.S. It's not uncommon to need 100 watt radios and 6db+ antennas to get 15 miles. That's what I need to run at the house just to get over the hill and into the big BBS. It's also why I can't shut off my radio anymore. Some of the locals figured out this was their ticket to packet outside the local valley. It's going to be interesting to see if the PHG circle theory works at all out here. All we need now is enough APRS activity to check it out (jab-jab).

I totally agree. use good commercial practice using all the proper filters
bottles pre-amps that any good two meter voice repeater has to use. Make
that receiver work, then turn up the power to balance the coverage.

I have seen way too many Wides that if they were two meter repeaters at
the same location, would be laughed off the band. No on would be able to
use them reliably. With the use of APRS mobiles on the increase we should
be able to come up with a standard test of real coverage. I hope the
concept is to serve local mobiles, not to be heard two states away.

Lets developpe a quick and easy test so we can learn to balance our wides.
We have done it with voice repeaters, now lets do it with mobile APRS.

The PHG circle does not work for me. I would need more like a 20 db offset as my station is on the side of a ridge. I love the ping feature to check someones PHG setting. I wish it didn't ring the bell! I can use the ping to check coverage of a digi or wide, five hops away. Send the ping out on a long path and fold it back to where you can see the results.

While pinging five watt mobiles moving at 60 mph I have found they need at least 25 watts on my end to reliably ack. Some of those mobile receivers are not optimized with their tncs. Some must run low power to keep the gps receiver happy. I have tried to set the PHG or MPP circle to approximate mobile coverage. I still have a lot to learn and am having a lot of fun playing.

There should be an automatic way of adding the elevation of wides. I do this manually so when some one uses their Y screen they can see my green house at 600 feet. "Bob why is your house green?" "I'll never tell." I am trying the relay wide concept as none of our wides have added relay to their mountain top digis.

W&KKE has just released camaps04.zip half a meg of great maps and several of the new one mile range local maps centered on active APRS neighborhoods.

camaps04.zip is at tapr or on the california APRS web page for easy d/load.

I wish you luck and look forward to your results. If your problem is intermod(ulation), or "power desense" (strong RF causing gain reduction in the receiver front end) then you are likely to get good results with a filter.(don't be lead into the misconception that you need a preamp to make up for small filter losses as that can actually lose what the filter gained!) If the problem is wide band noise directly on the RX freq. (classic urban high sky noise temperature) then there is little that can be done with filters. Try a directional antenna to get your beam pattern away from the noise sources (usually there are many) and good luck finding them. On commercial sites people often resort to putting filters, circulators and the like on OTHER peoples transmitters to keep their noise outputs on YOUR freq. down.

From: james keck <jkeck@smartlink.net>
To: Bob Bruninga <bruninga@nadn.navy.mil>
Subject: Re: APRSdr

The marathon went off well, your APRSdr performed flawlessly. We were set up with two laptops, one in City Hall and the other at the Sheriff's Command Post at the Finish Line. The one at City Hall was in the main communications operations center from which they dispatched the pickup vehicles and controlled the maintenance personnel which picked up the traffic cones after the course officially closed.

I operated from here at the home QTH, where I listened to the race communication activities and reports from each mile marker to update the displays.

The marathon was limited to 600 runners and was the 1st annual event to be held within this city. Next years race is expected to be open to 1500 runners. It was also considered a qualifying event for the olympics (whatever that means).

I was able to put together a standalone unit which we placed on a ROVER motorcycle which was used to dispatch for to meet a variety of miscellaneous requirements. I set the unit to BEACON its position every 2 minutes, however, noticed that when reviewing the HEARD list, it indicated a high of 54 during one hourly period, a couple of hours in the 40 range...The remainder were all below 30, which I expected due to terrain limitations....To explain the over 30 (2 minute) setup, I assume that because I had the unit's path set to Relay, Wide and sometimes could hear the standalone direct as well as through the WIDE, it would show 2 hits on the HEARD list, Correct?

In providing tracking of the Leader, First Male, First Wheelchair and First Female, was pretty predictable...however, attempting to track the Tail End Charlie proved to be a real chore. I think next year, a second standalone to place in a TAIL ROVER, would be of great benefit.

I did have a problem killing and deleting an object after I entered it in the system and set the following function. I finally picked it up and moved it to a far corner off the route, however, I continued to beacon the object until I later found a use for it....After the object finished the course, they turned back to yellow and I could do what I wanted with them....

270. PK-232MBX STA stays on

From: philkeys@olympus.net (Phil Keys)
Date: Tue, 14 Nov 1995 07:56:41 -0800
To: aprssig@tapr.org
Message-ID: <v01510101acce6b2a1825@[198.133.237.33]>
Rendered body type: text/plain

I have just brought up APRS 7.2D on HF for the first time using an AEA PK-232MBX. Everything seems to be working except that the STA light on the PK-232MBX is all on the time. I think this keeps the TNC from transmitting. Any ideas why it stays on?

I am receiving fine on 10,151.6 KHz. I see stations from the mid-West to the East coast and California, nothing in between. My QTH is the Olympic Peninsula in the North West corner of Washington state.

Thanks for the help.

I donno if everyone else saw it, but for the past few months, an outfit has been selling a 4 cavity helical resonator filter for 2 meters that has less than 1db insertion loss and -30db attn at 145.1 and similarly below the band. This unit is of EXCELLENT quality construction and is about the size of a small loaf of bread. It only costs \$89. !!!!!
Model DCI-146.4H

This thing is my dream come true!

Hey Bill, many thanks for the tips with MKMAPHK....your idea of making the grid system sounds like what I need to do. I seem to be missing something, that is, how do you draw the grid in mapfix16.exe? Guess you figured anyone doing this would already know how to make a grid. Read the text files that are in the APR574b, including the Basic Help Screen for Mapfix, and tried about everyway I could figure to draw it, with no success. Maybe someone else out there can explain to a novice. Would like to grid up the City of Charlotte here. Thanks for all the help again.

Lemme throw my 2 cents in here on pwr output. With a 3 dB omni on the roof, I can hit the WIDE that's, if the truth be told, gotta HAAT just above line of sight. And for only being 17 mi away, that ain't much. The pwr that I'm using is 2.5 W, from my TH-27, thru the DCI-146-4H intermod filter that the nice UPS lady just brought me from AES. I ordered it yesterday PM. Pretty good, huh.

I would rather hit the WIDE with a little power than pump a LOT of power into the air and mess up everybody's phones and TV's. It kinda reminds me of alot of people standing in a room, all shouting to be heard. It gets on one's nerves, and doesn't solve the problem.

I'll test the bandpass filter and let you all know how it works.

Amateur Electronic Supply, 1-800-558-0411, is selling the DCI-146-4H for that price. Also advertised in Nov QST on Pg 197. Rated for 200W. STAY AWAY FROM CATV MIDBAND TRAPS. WON'T HANDLE THE PWR OUT!!!

That's the one I ordered, and thanks Bob for the recommendation. (heard you last nite on newslne)

Well Bill see if i can explain this, i'm doing one right now for the whole state of Alabama (In 10 mile squares). start Mapfix16.exe and bring up a rough map of the city that covers the area you want to do in 1 mile maps. Now hit the ALT-R key and enter 1 (For 1 mile range). then to move the white 1 mile square box to your starting point move the cursor to the upper left corner of the area you want to cover. Then draw a line by placing your cursor at the upper left corner of the white box. hit ALT-N then pick you color, I use 2 most of the time. Now move the cursor to the right of the area you want to cover without moving the cursor Up/Down. When you get to the end hit the ALT-A key this will draw the line. Now start this process all over with the bottom left of the white box. Do the vertical lines in the same manner. Ones you have the grid covering the City bring the white box to each square by using the ALT-C after placing the cursor in the middle of that square.

Now what i do is only mark down the coordinnance for the top horizontal row, and the left vertical row. the reason for this is that you can realy get all the Lot/Lan measurements from them two figures for the whole gridwork.

Hope this helps

Bob Bruninga, WB4APR, hit the nail on the head. The TNC had been set up for Pactor and (I'm told) the DCD light stays on all the time (is ignored?). Turning down the DCD threshold until the DCD light went out was the answer. The TNC then can transmit. With the DCD light on, it always thinks the channel is busy and never transmits.

Thanks all
Phil Keys

APR REPLY: Dont even bother with a grid. Just chhose map centers every
2 minutes of latitude and 2 minutes of longitude. This gives you a
grid. Remember that a "1 mile" APRS map is 1 mile out from the center,
or 2 miles on a side. And 2 miles is 2 minutes of LATITUDE. The
longitude is less, as you go north from the equator, but this just lets
you have a little more e/w overlap on the maps. Then ask MKMAPHK to make
you some 1.2 maps on those centers....

To draw lines in MAPFIX, just move the cursor as if you wer adding
roads. Use the ALT-N to be gin a new feature and ALT-A to add points to
it.

In REPLY to the comment made here:

"A higher power level will not hurt anyone?" Sure hope you don't have any
people in that area trying to listen for the beacon on OSCAR 13 at 145.812
plus or minus doppler which can take it as low as 145.808 or so. Also the
Safex missions on MIR will be using 145.800 as a downlink at times and
there is likely to be some interested people trying to hear them...

APR COMMENT: We should run the minimum power necessary from all BASE
stations and digipeaters. PERIOD. Obviously, though it is TOPOLOGY
dependent. If you have a digi on a mountain 30 miles from the nearest
SATELLITE operator, then it can be greater than 10 watts... But if your
DIG is in the middle of a residential communitcy, then 10 watts should
be safe.

There is only 1 rule for WIDES: As WIDEly separated as possible. There
is no longer any need for little WIDES to fill in gaps for mobiles.
Those gap-fillers should be RELAY. And all mobiles should beacon via
RELAY,WIDE..... This, of course, requires that the WIDES also have a
dual alias of RELAY. Where you have flat land and big mountains, such as
CALIF, obviously, the mobiles can usually hit the WIDES from everywhere,
so those mobiles can just go via WIDE,WIDE..... But the overall
philosophy remains the same: WIDES should be WIDELY separated and RELAYS
should fill in the gaps.

Run MIMIMUM POWER for the sake of the satelite guys. WHen MIR begins
operating on 145.80, tell all your AMSAT buddies to set their monitoring
receivers to 145.805 so they dont have to hear packets, since the PLUS
doppler when the MIR approaches will be at 145.803 or so anyway...
If they are manning the station, then can down tune as the pass proceeds.

Well I have been trying to get a few maps made of the area but after seeing the FTP site I can't believe what I see. The "org.gz" files are quite a few just for the Eastern Section of West Palm Beach, 12 to be exact. In addition to this this is just for the transportation features of the GLS files, this does not include the water masses or borders! I can see several files for everything but this is several for just one feature, am I missing something??? There is one file that I downloaded last night but it was a std.gz file that did not work, it was big 1.6meg compressed (6.6 uncompressed) and after reading Gerry's message today I see that the other version is needed. It seems that the file I got last night was everything in one bundle but guess we can't use it.

Any input ?? Sure does seem like I WILL be getting that CD-ROM after all!

I need a clarification...

In the DIGI.txt, it sez that the height calculation to put into the BT is "Log 2(HAAT/10)". Now is this Log to the base 2, rather than Log base 10?

Something tells me I'm gonna dig out my math books. Of course there's ENCARTA!

The company is called DCI and they are located up here in Canada (eh!).

There filter is ok, but not as great as the one made from Sinclabs. You have to be careful you don't bang it, as it could detune it. I've been involved in some testing in both units. The Sinclabs one is by far the best, but at about 3 times the price. DCI does have an 800 number, so if you need it, let me know and I will dig it out while I'm at work.

Cheers...mike

World AIDS awareness day is December 3rd. I presented APRS to the organizers and they were impressed. They have asked us to provide 3 APRS stations and 8 operators. If you are on this sig and live in south Florida, could you try to help?
We are expecting 10, 000 (NOT A TYPO) walkers/runners for this highly public event. Please contact Mike KD4EMI@305-974-4153 from 8am to 10pm for more info.

I have designed a APRS shirt that features gps birds in orbit, ham radio, and "We know where you are" saying with space to add your callsign and Lat/long to it. I will issue these shirts to all of those who help. The shirt alone is worth the morning shift and is a neat design. (no I havent thought about selling it yet)
So if you help, you get at the least , a shirt, and whatever goodies and fun you'll have as well. APRS stations invited to listen in that day. We will link the event to HF.

(No jokes about the clean shaven and clean clothes note I made before)

This will be sort of like our own little MC Marathon.
Mike KD4EMI KD4EMI@AOL.COM

Once again!

When downloading the files from the USGS FTP site, there *IS* a system.

1. You want "optional" format files. So, get the ones that are something.opt.gz
2. In general terms, you want transportation. There are 3 types. the MTF files have little of value. forget them.

the RRF files are rail info. They can be useful and are not too big. But they are not usually of primary interest.

The RDF files are the ROADS. Get them.

3. The QUAD SHEETS are organized into 2 segments: East and West. The Quads are actually divided into 8 segments.

Segments 1,2,5 and 6 are in Whatever-WEST_State. Segments 3,4,7 and 8 are in Whatever-EAST_State. If you're sure of what QUAD you want, but not which side you're in, get 'em both.

In my area, the files are:

AU2.RDF01.opt.gz
AU2.RDF02.opt.gz
AU2.RDF03.opt.gz
AU2.RDF04.opt.gz
AU2.RDF05.opt.gz
AU2.RDF06.opt.gz
AU2.RDF07.opt.gz
AU2.RDF08.opt.gz

A quick pass with GZIP (-d option) unzips 'em all. I did, of course rename the files as I downloaded them to something I can deal with in DOS, since it can't handle long file names... and neither can qbasic in a real operating system, either! I usually rename them to something like,

AU2RDF03.gz

Unblock renders them 'AU2RDF03.DLG' and then they're processable using MKMAPHK1.

On another note: I was overcome by real work today. Putting CONV100D out is now on tomorrow's agenda. Apologies for that, but I had to beat on a problem that helps pay for the ham radios.

73, gerry

What follows is a preliminary, unscientific bench test of the DCI-146-4H Intermod filter. Cost is \$89, can be obtained from AES. Please draw your own conclusions. Note: I didn't notice any keyboard comments about a band opening last night, so I assumed there wasn't one.

Rendered body type: text/plain

Ed,

Yes Jerry and I have an arrangement that seems to be working so far. Currently we are both gating hf <-> vhf. Since we are located some 20 miles apart we think there will be little problems. I have good coverage to the north side of the chicago area, and Jerry, N9VHW, has good coverage to the west (and maybe south). What we don't know currently is when a gate comes in on hf with VIA GATE,WIDE, which WIDES are we each hitting. We don't want to hit the same WIDE as that would be redundant, but there does not seem to be a good consistent WIDE that covers a large area with a good receiver. As recently as a couple of weeks ago I could hit 3 WIDES direct from my house. Currently I can hit only 1 WIDE. with less than 10 watts, or 2 WIDES with more than 10 watts. (Bob: I have bounced back and forth between 4 w, 10w, and 30w several times in the last couple of days trying to determine what is best. I am currently at 10w.) I believe (correct me if I am wrong Jerry) that Jerry finds something similar. We are also finding that when receiving on hf, sometimes Jerry can copy the station and sometimes I can. The percent of the time that we both copy the hf station (particularly the weak and OFF FREQ ones) is actually much less than 100%.

Where we stand today is with N9VHW GATE covering the west and WD9ABE GATE covering the north, with hopefully little overlap on the WIDES being hit. So...from the chicago area if you want to get out on hf, just VIA WIDE,GATE will do it no matter where you are, perhaps except for the south side. Does this come to the logical conclusion that we need a GATE on the south side that does not overlap with the existing two?

Paul, WD9ABE

To convert from Log base 10 to Log base 2, simply devide Log 10 of the
number by Log 10 of 2.

In other words, the H cooefficient in #PHG = [Log 10(HAAT/10)]/Log 10(2).

But why bother, APRS will figure this out for you anyway. Just remember to
use height above average terain and not your elevation above sea level.

Later!

Hello again, i am still working on interfacing my computer to my garmin 45 hand held. Using the program garmin.exe, the gps will recieve the commands, but the computer will not acknowledge the data return. I am using a db9 connector and using pins 2 & 3 for data transfer and recieve. Even when hooking up a sig gnd it did not make a difference.

If anyone has hooked up the 45 can lend me a hand, It would be appreciated. Also does anyone use the Garmin windows program? I downloaded the gardown7.zip and unpacked it, same problem..

Thanks, N3OBQ

Rendered body type: text/plain

I have just posted an updated ALAFTRO3.ZIP and a README.ALA. This file has a few additional maps, but mainly the reason for a new upload is that i had to split up the MAPLIST.ALA into MAPLIST.ALN & MAPLIST.ALS since there is a limitation with APRS that you can have no more then 170 maps in one maplist, this is a bummer but a fact of life i guess. Don't forget to also D/L the README.ALA.

Rendered body type: text/plain

I was trying to get enuff GPS signal to drive a spectrum analyzer. I placed my normal GPS/LNA antenna at the focus of a 1 meter dish (to isolate one satellite from another and also give me about 20 dB gain). I still needed more gain to drive the spectrum Analyzer so I bought a radio shack satellite line amp (500 to 1450 MHz) but it does roll off quite a bit at 1575. I still cant get the signal high enough.

Does anyone know of a source for off-the-shelf 1.6 GHz line amplifiers or pre-amps? With coax fittings in and out? (and also some bandpass filters for 1.6 GHz)

Thanks!

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

>. . . I still cant get the signal high enough.
>DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

You may have enough signal, but not sufficient signal to noise. Since
the GPS signal is spread spectrum, you could have enough usable signal
without being able to detect it on the spectrum analyzer. You need a
VERY low noise amplifier rated at the frequency you want to use.
The signal will look like a hump in the noise floor.

Hope this helps. 73

Ok, now i'm really confused! I thot the reason that we had to go thru all these math calculations is so that when we tell a wide what to put in it's BT, that is was to tell the receiving APRS station how to interpret the info it gets.

.....uh, maybe there's an email miscommunication here. I'm the guy that is telling the TNC at the Wide site what to say.

Anywho, the HAAT of the tower base is minus 16 meters (I asked the station engineer). Converted to ftoots, I get -52.4', plus 180' for the antenna, gives me 127.5' HAAT for the antenna. Using the figures Bob sent last night, I get:

```
Pwr =10W      = 3
127.5' HAAT = 3 (conservative)
Gain=6dB      = 6
Omni          = 0
```

```
PHG = 3360
Am I right?

I have seen spectrum analyzers with noise figures 30dB over KTB!! You need good take over gain, or, a better receiver.

Beware of neat stuff with "to-good-to-be-true" prices. And \$89.00 for a front-end filter is a definate suspect.

The helicals that I've played with on UHF can get extremely narrow with reject levels in excess of -40db easy. But with filters, you really do get what you pay for. Most of the cheap cavities & helicals that I've seen and tested over the years tend to drift terribly, and the tuning slugs quickly get noisy and add further de-tuning or noise to the system. The helicals that I was working with were made from copper plate. I could almost sweep them at a few KHz and tell what the temp of that filter was at any given time. If this filter is a bandpass to keep out the commerical band, and you're using it in a temp controlled enviroment, you might be OK. If at all possible, sweep the thing, lose 2db and flatten it out a bit rather than try and peak it on your rx channel and take the chance of losing -6+db when it drifts. If it's a notch, check it carefully.

Other than that, go to ham swapmeets. Out here there are various commerical VHF & UHF cavities for sale all the time for less than \$90.00, and they're in excellent shape. Got lots o' dough? Open the Cellwave catalogue.

?? Anyone had a chance to sweep this \$89.00 wonder and really see what it does??

Yes, your math is correct and I'm sorry if I confused you, but here's how to get APRS to do the math for you:

Hit {I} to go to the Inputs Menu

Hit {P} to select PwrHtGain

APRS should then prompt you for your power in Watts, HAAT in feet, antenna gain in dB, and directivity in degrees.

APRS will then compute the #PHG coeeficients for you and place them into the APRSXX.CFG file in the root directory. Now APRS will report your #PHG to other stations.

I hope this helps to clear up some of the confusion.

Hi Marley... well The Gardown7 works fine here,
1. make shure that you have cable configured corectly
you may need to use a null modem adapter.
2. in the Garmin i/o menu select garmin/garmin
3. then select sent trk, will show 0 of 764 ready to send or
some similar on garmin lcd screen
4. you must do the above first before you run gardown7 else
it wont work.
5. type on the computer
gardown7 t s1 > tracktst.txt and enter.
T stands for track
S1 for comport 1 if comport 2 use S2
> means to redirect output from garmin from screen to file
tracktst.txt or whatever file name you want to give it.
6. at this point you should see the lcd screen on the garmin
begin to count up to the total points it stored in its memory.
7. when gardown7 finishes it will return you to the normal
dos prompt.
8. Have fun...

>front-end filter is a definate suspect.

I beg to differ..

They are not helicals, as you are used to in front ends of radios.

I have known Ralph Olds, the fellow behind DCI, for about 4 years. I have
been a customer
of his as well. Prior to the bandpass filter, he developed
a Digital Doice Recorder board for adding voice mail to repeaters using a
PC. The board was
great and was about 169.00 I think. It had multiple mailboxes and did
everything the DVRs for
that you hear on all repeaters do- only it didn't cost 1000.00.

I say this only because I think the guy is fair and not out to give anyone
a bad deal.

I am an owner of multiple (12) voice repeaters and an ATV repeater and because of that, Ralph contacted me when he was thinking of releasing the filter. I told him it wouldn't fly... too expensive at 160-199 bucks. So he went back and designed it to be cheaper to build. Now it is out for 89.00, well below the "impulse hamfest buyer's ceiling" of 99.95 that I think of.

It is *NOT* a pass cavity, and the tuning is coarse and covers a ham band, not an exact frequency.
If you want to pass (or notch) a particular freequency, go buy a cavity from TX RX or Wacom or whoever. If you want to pass a section of spectrum, try one of these type of filters.

Since many hams seem to whine: "Why can't I receive the Police and weather on my ham rig", the manufacturers are only too happy to oblige us. They simply leave off the front end of the receiver. Now we can pay DCI to make our receivers do what they should be doing... being selective.

Again, I haven't tested it, but knowing what I know about these types of filters, you should see a pattern like this on the 2 meter one. Hope the drawing comes out ok.

rwf@mindspring.com Atlanta, GA USA

APRS ANSWER: You might consider a small 2 or 3 element beam to favor the
North WIDE for the north GATE, and the western most WIDE for the west
gate...

The only place it makes any difference is in the MAPS-PLOTS-RANGE
command. And there it shows the range in Statute. More or less, the
range scales are Nautical...

```

APR REPLY. YES, unless there is some masking terrain. Even tho you have an OMNI antenna, your pattern may favor a given direction. If so, then you should give a directivity value in that direction.

= OR = If you have a single BAD direction, then use a directivity direction in the OPPOSITE direction.

APRS uses the DIRECTIVITY value to offset the range circle in the given direction.

```

An other name for this type of device is a "window filter". The window in this filter is the entire two meter ham band. Several hams in the area have purchased these filters and have reduced the pager intermod into their typical dual band h-t. Now they can use a roof top antenna with out intermod and desence from out of band signals. These are excellent for ares races or weather nets or any type of requirement that needs to use frequencies all over the band. This filter will not help with strong amateur signals in the same band.

Once hams see these filters in action, they want one. Check it out.

```
> It is *NOT* a pass cavity, and the tuning is coarse and covers a ham band,
> not an exact frequency.
> If you want to pass (or notch ) a particular freequency, go buy a cavity

> of filters.

The folks operating a WIDE-RELAY digipeater at a communications site or close to high rf should use a pass cavity. The pass cavity only allows signals on the frequency to pass through to the receiver. This filter would look like a mountain peak rather than the flat top mesa of the window filter. The steeper the slope the better the filter.

If there is a kw 152 MHz pager at the wide-relay site, you may need an additional notch cavity tuned to the 152 pager frequency. You can attenuate or notch out a single frequency 500 kHz or greater from your receive frequency. Many of the commercial duplexer catalogues have charts and a small section on the theory and common uses of these devices.

Using pass cavities in simplex vhf amateur radio is not uncommon. Try one next time you contest. They tune up real easy if you have a bird thru-line watt meter, tune for maximum forward smoke. You will be able to hear the weak ones as the noise floor of the receiver has been lowered. I know of several serious satellite enthusiasts who could not operate without a pass cavity ahead of the preamp and receiver.

For home use you can't beat these new window filters for general operations.

The HAAT for a commercial site is on each license, posted on the equipment or on file at the site owners office.

324. Re: [APRSSIG:4437] Re: receiver desense

From: rwf <rwf@mindspring.com>
Date: Thu, 16 Nov 1995 00:40:38 -0500
To: aprssig@tapr.org
Message-ID: <199511160540.AAA03698@borg.mindspring.com>
Rendered body type: text/plain

I need to correct one thing on what I said.

The 2 m version of the DCI filter does have helixes inside, so it is
"Helical". It was the 440 one that is like an interdigital filter.
It still works the way I said, though.

And the attenuation just outside the ham band on the 2m one is
more like 40-50 db rather than the 30 db I estimated.

I've been hearing fantastic reports on their performance.

And... from a Ham tenant on many commercial sites, please consider this
piece of advice:

I hope that those of you putting Digis up are
not planning to use any kind of filter (whether it is a notch, a pass, or
one of these
"windows 95 " filters :) just to compensate for the poor practice of putting
Ham Equipment at any commercial site (or any hostile environment for that
matter)
Find a commercial surplus unit if you can. You will lose a lot less hair.
And your co-tenants
will point a lot less fingers at you. Go ahead, spend the 50 bucks for a
Mitrek, Micor, or Master II
or similar commercial radio and use it. Save the ham rig for the shack
or your car.

Ralph

326. Maps in 2min segments

From: dlarsen@spider.lloyd.com (Don Larsen)
Date: Wed, 15 Nov 95 22:25 PST
To: aprssig@tapr.org
Message-ID: <m0tFxxkw-000TrRC@spider.lloyd.com>
Rendered body type: text/plain

Hi to all on the SIG,

A couple of weeks ago someone posted a note about how they put together maps of large areas that were divided into 2 minute blocks. I have been unable to relocate that posting and would like any input that you have. I am currently working on maps for El Dorado County Ca using the makemap program and will share them with all when they are done. Thanks for the help.

Sorry, I didn't make it clear. STA on means that the TNC has one or more unacknowledged packets waiting to be sent. DCD on means that the TNC has detected incoming packets (has detected carrier from the transceiver). The TNC then won't send outgoing packets until DCD goes off (frequency is clear).

Hope this helps.

Rendered body type: text/plain

Just to let every mapmaker know, there's another bug in MKMAPHK1. If you enter a filename larger than then 8 characters it will let you go through the whole process of making the map and when finished it will let you know there's a filename error. So make sure you use 8 or less characters for a filename.

Hi All, an unsolicited testimonial.....:-)
I rushed out a picked up one of these filters when they first appeared at the local ham supplier, (I have an Alinco DR1200 at exposed location :-() and it totally eliminated out of band interference like pagers and everything else that was keying up within 50 miles!
It's the only way to go.....

Message-ID: <marley.1166910545A@lu.lincoln.edu>
Rendered body type: text/plain

I just found the problem. It seems that there is not enough logic level when using the Garmin 45 on battery only. I made a power cord (8 pin din worked great) and the levels were strong enough to be read. As to the software, gardown7.zip did work, the garmin.exe did not do so well.

Thanks to all who gave advice and comments. The best way to learn is to ask a question.

Hi Ron, I found out my problem. The logic levels on the data stream are not high enough when operating on battery. So I made a power cord and it works fine. Gardown7.zip worked great after that.

Thanks for your help!!

```

Once again!

When downloading the files from the USGS FTP site, there *IS* a system.

1. You want "optional" format files. So, get the ones that are something.opt.gz

2. In general terms, you want transportation. There are 3 types. the MTF files have little of value. forget them.

the RRF files are rail info. They can be useful and are not too big. But they are not usually of primary interest.

The RDF files are the ROADS. Get them.

3. The QUAD SHEETS are organized into 2 segments: East and West. The Quads are actually divied into 8 segments.

Segments 1,2,5 and 6 are in Whatever-WEST_State. Segments 3,4,7 and 8 are in Whatever-EAST_State. If you're sure of what QUAD you want, but not which side you're in, get 'em both.

In my area, the files are:

```

AU2.RDF01.opt.gz
AU2.RDF02.opt.gz
AU2.RDF03.opt.gz
AU2.RDF04.opt.gz
AU2.RDF05.opt.gz
AU2.RDF06.opt.gz
AU2.RDF07.opt.gz
AU2.RDF08.opt.gz

```

A quick pass with GZIP (-d option) unzips 'em all. I did, of course rename the files as I downloaded them to something I can deal with in DOS, since it can't handle long file names... and neither can qbasic in a real operating system, either! I usually remane them to something like,

AU2RDF03.gz

Unblock renders them 'AU2RDF03.DLG' and then they're processable using MKMAPHK1.

On another note: I was overcome by real work today. Putting CONV100D out is now on tomorrow's agenda. Apologies for that, but I had to beat on a problem that helps pay for the ham radios.

333. Topo map on CDROM

From: mcinnis@austin.ibm.com
Date: Thu, 16 Nov 1995 12:38:15 -0600 (CST)
To: aprssig@tapr.org (list aprs)
Message-ID: <9511161838.AA17373@babe01.austin.ibm.com>
Rendered body type: text/plain

Do any of the USGS CD-Rom's have anything like a topo-map generator, or are they just collections of data with no viewer?

i.e. I'd like to pop in my USGS CDROM and have an online topo map that works something like Street Atlas USA?

I'm getting the impression that what I'm after doesn't exist yet, but I thought I'd ask.

334. Re: APRTRAK

Rendered body type: text/plain

I just posted a new copy of APRtrak.zip for FTP @tapr.org in the directory
.....tapr/SIG/aprssig/upload

APRTRAK version 0.5 fixes two bugs and adds a new feature as follows:

- * Fixes the bug in 0.4 that was stuck in time zone -4
- * Fixes the loading of 2 line element sets
- * Adds the ability to monitor with MCOM ON. This feature is important for monitoring SAREX (and MIR) packets. Since most packets being transmitted by both of these spacecraft are DISC-BUSY packets with no other text, they are normally ignored by APRtrak. With MCOM on, these meaningless packets are displayed and ALL packets including these are saved on the ALL LIST and subsequently saved in the log files. This is so you can see who all is still trying to connect to the TNC. The L and P-LISTS will still only capture UI packets which contain station status or position information.

FOR ROY WELCH:

Roy, remind me of the place to upload the new version for AMSAT, and I will upload it, since i already have a copy on my server.

Rendered body type: text/plain

The USGS CDs are Digital Line Graph data.. NO! Elevation data, that is in a different set entirely..

The CDs as is, come with some poor DOS software. It is, for the most part, left to the user to write their own code to access this data.. Also, the data

is in such a format that you really would NOT want to use it in its current format for 'real-time' displays. It is good for adapting to many different types of applications, but is way to big and bulky for going straight to the screen.

Message-ID: <199511162058.PAA13917@ag9v.ampr.org>
Rendered body type: text/plain

I know this is a bit off topic, but this seems to be a good place for general GIS information...

I'm looking for software that can use the DEM (digital elevation map) data to produce path profiles. In other words, you plug in the lat, long, and antenna height above ground at each end, and it shows you whether you have a line-of-sight path.

I've found a program called MicroDEM that has this capability, but it's buried amongst tons of other features and overhead that I don't need. Is there any other software out there that will massage the DEM data this way?

I've seen this before when my Transmitter causes RF noise on the cable between the TNC and Computer. Try moving your data cable or adding Ferrites at either end, or don't transmit (!).

The RF from my HF transmitter does couple into my data cable and causes the next packet received to have garbage as the first few characters.

The people from Sinclabs bought one from me and they swept it looking for SWR/
and other nice features.

All I can say is "You get what you pay for". It's not bad, but it can have a
high swr at the band edges. I also know of a customer who still had some
intermod problems, but they went away with a new Sinclabs one.

I can offer the results to those who ask, but I don't want them posted
publicly.

342. Digi PHG pattern offset

From: "PETER L. LASCELL" <LASCELL@lecs.ericsson.se>
Date: Fri, 17 Nov 1995 03:01:47 +0100
To: aprssig@tapr.org
Message-ID: <01HXQEVZC4RM8Y5AIT@edt.ericsson.se>
Rendered body type: text/plain

The PHG propagation range indicator has seen recent discussion here. For
the near normal installation the PHG options would seem all that is required
assuming the correct numbers are input, and the digi operators look at
what is being displayed and confirm the range is realistic for MOBILES.

Here along the Blue Ridge mountains we have a unique condition. Not only
do we have digis that are located on the sides of mountains, we also
operate in the NRQZ, an enviroment providing RF interference protection
toward Greenbank, WV. Some digis may have directional or null patterns to
provide this protection. Obviously the PHG direction BIT was not intended
offset the patterns to the extreme we see in Virginia. Major lobes with
almost nothing behind them.

If other digi operators who are not so lucky to be able to operate from the
top of the hill or tower with omni patterns would speak up, maybe there
would be shown a real need for more DIRECTION BITS to move the offset
further toward the edge, or even a different pattern than round.

Is there a need for Bob to change it? Speak up please.

Since I have the bandwidth occupied... Is there "any" APRS VHF activity
in eastern Virginia, say Richmond, Petersburg and east to the coast? We see

nothing from the east or southeast on 145.79 on digis along the Blue Ridge. If you are out there, try digis WA4TFZ, W4BLD-1, or WA4BWB-3. Response to this Virginia activity inquiry might be better handled directly to my e-mail as it has little to do with the whole world of APRS.

Thanks for listening... Pete Lascell W4WWQ Forest, VA

I stand by my original claim, these filters are FANTASTIC for \$89. I took mine to work and measured it:
IT was dead flat across the band with only 0.2 dB loss from 144.5 to 147.5
It was within SPEC of 1 DB at 144.2 to 148.1
it was 16 dB down at 142.6 and 150.0
it was 30 dB down at 142.0 and 151.3
THat will knock the heck out of any pagers!

Hi all.

I just uploaded my first try at maps for Indiana. They are heavily Bloomington-oriented. I'll be working on more when I can download more data. I can't seem to download any right now. Has the USGS been furloughed?

Hi All,

Recently purchased a nifty Garmin 45 handheld GPS, but my dealer (HR0) does
not have any accessories or connectors yet. Garmin uses a connector similar
to a standard 4-pin mike jack, only the pins are much thinner. Has anyone
found a source of the Garmin 45 style connector?

By the way, the remote antenna kit that Magellan sells for their new
handhelds works fine with the Garmin 45 and is much cheaper. Has anybody had
any luck building a remote GPS antenna yet? Garmin wants \$130 for theirs,
which is kind of silly. It must be possible to homebrew one or find a surplus
source...

Two months ago in QST there was an article on how to build a GPS
receiving patch antenna. I talked to someone out here in Calif that
built it and has had great results. It's VERY inexpensive and can be
made from parts available at the hardware store.

355. PHG for wierd patterns.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 17 Nov 1995 13:46:15 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951117133632.3872D-100000@greatlakes>
Rendered body type: text/plain

Possible new PHG format. I am only tossing this out as an IDEA. I am not promising that I will implement it. But see if it solves the problem for the DIGI SYSOP in trying to show his true PHG coverage. Personally, I think the single OFFSET circle curenly displayed is close enough for our purposes...

IF you set a directivity then the GAIN figure will be used to modify the offset of the circle in that direction. Right now, the offset for DIRECTIVITY is always 1/3 and 2/3 (more or less). This would permit you to better indicate the coverage of a BEAM or a repeater that has a total NULL in one direction. I can ONLY draw circles. I can draw ellipses too, but ONLY along the horiz and vertial axes.

Secondly I will consider adding a second PHG option. This will allow you to indicate with two overlapping circles the coverage of your digi. This would be done as PHG5653&34 Where the &34 means a second circle in the direction of 3 (135 degrees) and a gain of 4....

I'm not sure I understand. Is "Hypsography" the term for such a map?
35% of the country is done in terms of what? Is work in progress for
"topo on a CD", or what?

Rendered body type: text/plain

Hi Bob,
You are correct, the people doing the review are in fact making a competitive product, and normally, I would take their result with a grain of salt. To the credit of both, they only tested one unit (and it may have been the worst of the lot) and both the people who did the testing are friends of mine....

That said, I think that the DCI product is great for the price! The more expensive one meets its specs better, but if the DCI unit does the job at 1/3 the price then that's great! Since I am the amateur retail business, I often find people who want the best they can get at no money (don't we all...hi hi). That is the intent of my discussion.

Just so all know, the DCI product has outsold the Sinclabs one by about 10:1, and it is based on price.

I really hope that DCI does well, as they are a Canadian Company and they are pretty good to me on the phone.

cheers to all...mike

Subject: Re: Filter

Mike,

Thanks for the rapid response. Yes it is typical for filters to have high VSWR at the band edges because the stop band "attenuation" of filters usually does not come from absorption, but rather from mis-match loss. In other words, the VSWR has to get real bad for the attenuation to be high. There is usually a trade off between holding on to good VSWR at the band edge, and holding on to good phase response at the band edge. Look at the Chebychev and Butterworth filters as examples of that.

If the coils are not on forms then there are serious mechanical and most likely temperature problems. But like you say, at \$89 you are still getting a lot of performance per \$.

It's a term the USGS generated, near as I can tell. At least none of the experts here in the lab recognized it! They have elevation models of ~35% of the country completed and available (theoretically) via FTP. Using the Web they have a nice graphic to tell you what's done and what's not.

Tell us what it does.

Can it handle the stand alone tracker function on the gps port when aprs is
not running on the computer port?

Does it go into stand alone tracker mode automatically when aprs is not running?
If not, how do you change modes?

What things can it do that other tncs can't?

Thought I'd let you know, my remote antenna for my Garman 50 cost about \$18.00
Don't know about yours but the GPS 50 has a removable BNC antenna. Radio
shack makes a window mount 2 meter antenna base for about 14.95 .. part
number is 23-023. then you need a 90 degree adapter for the antenna BNC so
it will point straight up. Radio shavk also has this adapter. total cost
abt \$19.00 >

Hypsography is defined in my Webster's New Colligiate Dictionary, 1952
edition, as topographic relief from the Greek hypso meaning heights.

I believe that the original question was if a map generator or viewer was
available for the data. I have not found one yet for borders (bd), public
lands (pl), or the hypsographic (hp) files. I do wish we had an extraction
program that would handle all the available files.

Here's how we do it in the Repeater Coordination "biz.":

Get several topo maps for your area.
Mark your position
mark the 8 compass points N NE E SE S SW W NW
Draw rays out 10 miles
mark points on each ray at 2 4 6 8 10 mile distances from your QTH
Determine the terrain elevation by using the contour lines at each of the 40 points
Add up all the elevations and divide by 40
You now know the Average terrain elevation.
Compare it with yours to get HAAT or (-HAAT)

Rendered body type: text/plain

I am trying to get APRS to run from my 8088 twin 3.5" drive laptop.

It starts, loads the local map, then starts beeping like mad. It seems like the only time it stops beeping is when it does a screen re-draw. Also, up in the "To Go" box in the upper right corner, there is the msg

COMM-Bad#

Any suggestions?

Richard Amirault

That works for repeaters, but they are generally located up at high points on the topography. I would most likely be less accurate for "regular folks" in more down to earth situations.

For instance, I have hills higher than my roofline, both south and west, closer than 2 miles distance. In the above formula, those hill would not be taken into consideration.

YES THEY WOULD. YOUR HAAT is NEGATIVE in those directions. PERIOD.

APRS accepts a value of zero.

That formula is the standard FCC haat formula for commercial station licenses. It works where ever the station is located. The accuracy stays the same.

> For instance, I have hills higher than my roofline, both south and west,
> closer than 2 miles distance. In the above formula, those hill would not
> be taken into consideration.

HAAT Height Above Average Terrain

If you want more accuracy for your station, you can use the 3 second elev.data base. Or you can take readings every one mile on the radials and divide by the number of points or you can read every half mile, etc. Remember the haat is just an average. Many times in our area the haat is a minus number as the station may be on a good 500' hill but there is a 3000' foot mountain range within 5 miles along one side. The haat is a circle, your station may not have a circular coverage so it could go to a negative haat.

Most commercial fcc rules set the station power level by haat, so you want a low or negative haat to run higher power. Pagers can blast downtown but have to lower their power levels at high haat sites.

Well, after some more experimenting, I found that I had to create my

cfigxx.apr

file, on my desktop computer. Using the ports,speeds,etc on the laptop.
Then copy to file to the 720k floppy.

I was still having some minor problems, until I created empty subdirectories on the floppy that matched my desktop computer.

Now that everything seems to be working, I'll have to try it out in the car!

Yes, and that is what I use....

But if I remember the formula, the closest point taken into consideration is 2 miles away. (formular given for computing HAAT) How can topography 1/4 mile away be a part of such a calculation? (I must be missing something here)

For all of you who are getting this list and do not want it, please read the following.

It was posted by Greg Jones a few weeks ago. Both persons who asked have been sent a copy via Email as well. Greg says that our Host, Keith Sproul can further assist if needed.

REPRINT BELOW:

Hello -- here is the information on the listserv.

Also -- if you have a problem with getting off, you should contact Keith Sproul or who ever Keith has handling this issue, since Keith is the Chair of the TAPR APRS SIG. The SIG Chair is responsible for these issues.

To unsubscribe, you just send e-mail to 'listserv@tapr.org' and in the message say
unsubscribe aprssig The problem happens when you switch providers and do not unsubscribe before the move. The list system we use (a freeware version) looks at the incoming message based on your sunscribed account, so if you change -- you no longer are at the other account. If this happnes you have to contact the SIG chair to correct the siutation.

Cheers - Greg

Greetings from TAPR!

TAPR can be reached via the Internet. The Automated Information Server that TAPR provides allows anyone to request information on TAPR, products, newsletters, and lots of other files. To find out more about this service, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

help (for a brief set of instructions)

index -all (for a list of all file by topic area)
list (for a list of TAPR Mail Groups)
get tapr taprinfo.txt (or info on TAPR)

In the above message example, "help" retrieves a brief set of instructions for info, "index -all" retrieves a list of available files by topic and "taprinfo.txt" retrieves a text file containing information on TAPR and what TAPR is all about. If you want to retrieve several text files with one message, use a separate line for each "get filename" request.

Special Interest Groups

TAPR maintains several SIGs in various areas. To get the latest list of SIG groups, send an e-mail message to listserv@tapr.org with the subject line "Request" and the following text in the body of the message:

list (for list of mail groups on TAPR.ORG)

To request the information on any mail group, send an e-mail message to listserv@tapr.org and in the message text include:

information listname (where listname is the name of the mail group)

When you are ready to subscribe, send e-mail to listserv@tapr.org with the following command in the message text:

subscribe <list> <your name>

List should be the name of the mail list you want to join and Your Name should be both your First and Last Name. BE SURE NOT TO USE THE "<" and ">" in your message. Example: subscribe aprssig John Jones

Current SIGs include:

| | |
|----------|---|
| NETSIG | Regional Networking SIG |
| BBSSIG | BBS SIG |
| HFSIG | SIG on HF Digital Topics |
| DSP-93 | SIG for those that are building TAPR/AMSAT DSP-93 kits |
| APRSSIG | SIG on APRS |
| TAPR-TNC | SIG on TNC Issues |
| TAPR-BB | Announcement channel for TAPR bulletins and information |

FTP users

The TAPR Software Library is now available via anonymous FTP. You can access the library by ftp access to 'ftp.tapr.org' in the directory /tapr. Login in as 'anonymous', with a password of 'your_account@internet_address'.

Packet Raido and TAPR is on the World-Wide-Web!

The series is accesible through the Packet Radio Home Page at this URL:

<http://www.tapr.org>

What's here? A page of links (the Home Page), the TAPR Home Page, a page of Packet Pioneers and Contacts, a hypertext packet primer and FAQ, and more.

So Richard, Don't go out 10 miles in 2 mile increments. You didn't say whether it was for a digi or a home QTH. Change it so you get an "average" for *your* situation Do it every .5 mile. Or whatever.

I have recently got APRS running on an old Zenith 8088 laptop with dual 720K floppies, no hard drive. So it can be done.

Sounds like you have a problem establishing communication with your TNC. What TNC are you using? Is the baud rate correct? You will probably get other more specific responses?

Good luck

Someone wrote:

> But if I remember the formula, the closest point taken into consideration
> is 2 miles away. (formular given for computing HAAT) How can topography
> 1/4 mile away be a part of such a calculation?

REPLY: The formula is just a guide, Height above average terrain is just that. Take as many points as you want spaced as pften as you want, every inch would also do. Add them all up and divide by the nuber of points. The result is the HEIGHT OF AVERAGE TERRAIN. Then compare your antenna height to that height. Many HAMS will find their HAAT to be less than zero, hi hi. The FCC suggested formula of every 2 miles is simply to avoid a lot of number crunching and still give a reasonable answer.

394. ID packets

Rendered body type: text/plain

Since APRS puts all UI's with POSITS on the P-LIST and puts all other UI frames on the L-LIST, only the latest non-posit UI shows up on the

L-LIST. Further, since many TNC's occasionally send an ID packet to ID, this would normally overwrite the stations last legitimate STATUS or BText on the L-LIST. (not desired)

To keep ID packets from overwriting good BTEXT data on the L-LIST, APRS has always ignored ID packets UNLESS THEY are the FIRST packet received from that station. This works fine except for when the ID packet is the ONLY packet received from a station and it has the POSIT in it.

Someone just reported that all X-1J BEACONS are sent to ID, and that they therefore fade to gray after 2 hours. The purpose of this message was to say "too bad" but I guess I could check to see if the packet TO ID has a posit in it and if so, to accept the packet even after the first...

I have just tried using the basic program GPSTOHST.BAS in the APRS distro for the first time and was surprised at what I found. I had never run it since I had never bothered to collect raw GPS data for mapmaking and found that it will not read \$GPRMC data.

The program does mention at the beginning that it will not work with RMC data or LORAN and that several lines need to be changed. I have never done any basic programing so I need help, please! If someone can make those changes and attach it to a message for me I would appreciate it, or maybe UPLOAD it to the TAPR directory for everyone else. I am surprised that this has not come up in the past. Garmin GPS units use the RMC statement and the Garmin seems to be a popular unit among the APRS users that I have spoken with.

Well did the politicians lay off the computer system for the USGS also?? I have tried several times for 2 days now to get DLG files from the USGS FTP server and all I get is either Error 404 or Access to the Server has Timed out.

I had been able to access it after the problems in Washington had started but Friday night was the last time I was able to check in.

Folks- (sort of directed to Ron Kramer, since he is a KPC3 expert)

A couple of us have been playing KPC-3 stand alone tracker this weekend. We have noticed something that puzzles us.

I played with the GPS options in the KPC3 and have it working correctly except for this:

We are supposed to connect to the PBBS and use the LTRACK command to dump

the track history.
Won't work. The PBBS doesn't seem to know what the LTRACK command is.
The buffers are set up properly, per the instrux here and in the manual.
Has anyone gotten this to work?

BOB et al.

After playing with the GPS/KPC 3 trackers, I decided to try something else. I wanted to see the various symbols that can be displayed when data is received from a stand alone tracker. In my experiments, I began to wonder is something about APRS broke a while back and no one noticed.

History:

1. A few times during demos I wanted to set up a bike symbol from the PC running APRS. I inserted my position and told it I was a "bike". Each time I showed up as a balloon. This even happened during our Atlanta workshop with Bob APR, but I think it was after he left.

2. W6PNC turns into a "Moving Lighthouse" rather than his normal symbol mobile. Happened during Bob's presentation. Bob thought it just might be a "glitch" due to the HSP or something on W6PNC's end. If that was the case, why would it stay as this symbol rather than correcting itself on the next transmission?

3. I misplaced the power supply to my laptop this week. Suffering mobile APRS withdrawal, I wanted to see the car on the screen while at home, so I connected to the remote sysop feature of the onboard KPC-3 and tried to start the beacon going.

I set up the Beacon every one min and set up the correct unproto. I set the Btext as follows:

```
BT !3355.00N/08466.47W I net the Call to N4NEQ-15 (for a van)
```

I showed up as a tiny 1 pixel dot. No Van

I then added the /{v} to the Btext as follows

```
BT !3355.00N/08466.47W/{v}
```

The displayed symbol changed to the "Dot" that you get if you let the symbol default when you first run APRS. No Van
Is this the correct format? Was the / before the {v} needed?

When I changed my ID back to N4NEQ-9 and kept the {v}, The symbol changed back to the 1 pixel dot.

Beacon interval lwas 1 minute, so It refreshed often enough.

I was using APRS74 for receiving.

Is APRS broke, or am I doing something wrong and just not following instructions.

Oh... and look for our "wonderful" user with the following path on his U-2000 WX station. He does not care to listen to any

reason regarding network management and bandwidth use..

APRS VIA CALLSIGN, RELAY,GATE,GATE,WIDE,WIDE, RELAY

If you would like, I'll pass along his address for the flames <g>

Do you connect to the PBBS or the REMOTE?? Connecting to the REMOTE gives you access to all the KPC-3's commands.

Just a thought...

It has been reported to me that 2 of our wide/relay digis are not relay frames with RELAY as the first part of the unproto.

In one case we are using a KPC-2 with mya wide and myn = relay. It is difficult for us to test this digi as it is so far away.

Has anyone seen this problem?

(To Ron by copy)

Did sean has relay as the first part of his unproto string when he was testing this??

Well, I'm no Ron Kramer but... it works fine for me.

You have to type

LTRACK n

where n is the number of past positions you want to review.

Remember though, that the track buffer only holds posits that have been beacons based on the intervals set by BLT. If BLTs are all 00:00:00 then there will be no track.

Won't work. The PBBS doesn't seem to know what the LTRACK command is.

Has anyone gotten this to work?

RE: [APRSSIG:4516] ID packets

Larry Griffin <largriff@onramp.net>

To keep ID packets from overwriting good BTEXT data on the L-LIST, APRS has always ignored ID packets UNLESS THEY are the FIRST packet received

> Do it every .5 mile. Or whatever.

APR REPLY: I disagree. Always go out 10 miles, or the value is meaningless compared to the standard. You can use any number of points at any spacing you want, but there should be enough to get a good average representative value. That is your HAAT. If you have hills in one direction, that is why APRS allows you to OFFSET your pattern in a favored direction...

> and told it I was a "bike". Each time I showed up as a balloon. This even
> happened during our Atlanta workshop with Bob APR, but

APR REPLY: Yes the docs and program were different. The Sailboat,
Helo and Bike/Bus SSID's and the APRS program were different.
Hoepfully the new DOCs with 74b match the program...

> 2. W6PNC turns into a "Moving Lighthouse" rather than his normal symbol
> mobile. If this is a glitch why would it stay as this symbol rather
> than correcting itself on the next transmission?

APR REPLY: The symbol is established on the FIRST receipt of a posit.
>From then on, only the POSIT is updated... This is the required logic
(although I cant remember the exact reason now). And we do see this
occasionally. More testing needed, but Im sure it is because of a
garbled HSP switching in the middle of a posit

> I set up the Beacon every one min and set up the correct unproto. I set the
> Btext as follows: BT !3355.00N/08466.47W with the Call of N4NEQ-15

APR REPLY: THE ONLY TIME THE SSID IS INTERPRETED AS A SYMBOL is when the
pakeket contains RAW gps data... Not a BText...

> BT !3355.00N/08466.47W/{v}

APR REPLY: to do this, just put v after the W... Again, the {v} is only
for stand-alone trackers outputting RAW gps data. Then the {v} must be
the first 3 chars in the BText (not a posit)

We had the same problem here with our KPC-3. It turns out that when you use the "MYNode" call for Relay (or whatever) you have to set "USERS" to at least one and NUMnodes to one, also. You then also have the added convenience of being able to actually use it as a node by doing a conventional connect to "relay" to aid in dropping a short message in someone's maildrop.

414. KPC 3 Tracker (How TO)

From: kc5ejk@onramp.net (Robert Winingham)
Date: Mon, 20 Nov 1995 12:46:00 -0600
To: aprssig@tapr.org
Message-ID: <v02130501acd679c0db2e@[199.1.11.102]>
Rendered body type: text/plain

A short version of this note is a file called KPC3.TXT in Bobs APRS README directory of the APRS DOCS.

How to use the KCP-3 TNC as a remote GPS Tracker (Rev 1.1)
=====

Setting for which NEMA sentences you want to record or beacon
You get to set up to 4. I use only two

GPSHEAD
1 \$GPGGA
2 \$GPRMC
3
4

The LT buffer filled with real GPS data

LT
1 \$GPGGA,064301,3250.743,N,09645.669,W,1.05,2.6,236.7,M,-24.8,M,,*71

```

2 $GPRMC,064303,A,3250.742,N,09645.668,W,002.4,121.2,040695,,*06
3
4

```

The LT buffer when the GPS is not seeing any satellites.

```

LT
1 $GPGGA,100552,,,,,0,00,,M,,M,,*65
2 $GPRMC,100551,V,,,,,,020695,,*39
3
4

```

Setting the beacon time for the GPS data (Also the storage time)
 I use \$GPGGA two times a min and \$GPRMC once a min.
 Note the offset so RELAY stations have time to respond

```

BLT
1 EVERY 00:00:30
2 EVERY 00:01:10
3 EVERY 00:00:00
4 EVERY 00:00:00

```

Setting for the output APRS format

```

LTP
1 APRSM VIA RELAY
2 APRSM VIA RELAY,WIDE
3 NONE
4 NONE

```

Setting the buffer storage inside the TNC to save the GPS data.

```

LTRACK
LTRACK 5 LT1 LT2 LT3 LT4 or
LTRACK 5 LT2 for only saving the LT2 data which is $GPRMC
per the GPSHEAD setting.

```

With the standard 32K of memory 17 is the largest I could set this value. You can add more memory to the TNC for a larger buffer.

Note the data is stored in the buffer at the rate set by the BLT beacon command and not the rate the GPS sends data to the TNC.

```

INTERFACE GPS          When the TNC is next powered off/on it will start
in GPS mode.          INTFACE { TERMINAL | NEWUSER | BBS | KISS | HOST |
GPS }

```

I also use the Software CD setting.
 CD SOFTWARE

How to READ GPS track DATA from the TNC buffer:
 =====

You can read the TNC buffer data remotely via radio or by attaching a local computer to the RS-232 port.

login to the TNC BBS as callsign-1

LTRack n [string] will DISPLAY LAST n MSGS IN TRACK BUFFER

```

LTRACK 50          Read 50 lines of data from the buffer
LTRACK 50 $GPGGA    Read 50 lines of $GPGGA data from the buffer.

```

The data is dumped back in LIFO format (last in first out). That is:
 it is backward of what you are expecting for a trip log.
 I use Mac BBEdit program to reverse the lines.
 The data will plot with APRS even if the trip log is backwards.

1. ### The next person to call KAM might want to ask them why the buffer reads back backwards. ###
2. The remote login is to change parameters.
3. To see the LTRACK command using callsign-1 login it might be that you must be the same callsign ?? Let me know if so and I will change the note.

Sorry, bait n' switch is not allowed. You mentioned that that Magellan antenna is much cheaper than the Garmin and went on to mention the price of the Garmin instead. So. . . . How much is the Magellan? That's what I wanna know.

Also, the 4 pin XLR connector does work on the -45

419. Garman GPS mobile antenna for about \$17.00

From: jkerns@usit.net (jim kerns)
Date: Mon, 20 Nov 1995 17:23:26 -0500
To: aprssig@tapr.org
Message-ID: <199511202218.RAA09113@use.usit.net>
Rendered body type: text/plain

I have seen numerous questions about obtaining Garman GPS mobile antennas.

For what it is worth I have a Garman 50 which has a removable BNC connected antenna. I went to the local Radio Shack store and purchased a window mount 2 meter antenna base which includes the coax and the mo8unt with BNC connector. No antenna is included. Price for part number 20-023 \$14.95 plus tax. get a 90 degree BNC adapter also at radio shack to make your GPS antenna point straight up, hang on your vehicle window and your in business for APRS/GPS mobile for around \$17.00 to \$19.00. I used mine across country and it works fine except in very near, steep canyons where the antenns looses LOS, as I presume any antrenna would.

Hope this helps someone looking for a reasonable priced, no build mobile receiving antenna for their GPS.

> Won't work. The PBBS doesn't seem to know what the LTRACK command is.
>
>The buffers are set up properly, per the instrux here and in the manual.
>
>Has anyone gotten this to work?

Whait is sounds like to me is that you did not set your LTRACK buffers before you went to the GPS mode. If you did not do this when you connect to the PBBS you will not see the LT command in the prompt line.
Go back to terminal mode and set your LTRACK buffers

LTRACK 15 LT1 LT2 LT3 LT4

This will set your ltrack buffers to 15 k of ram and it will save any beacons that are sent out with any of your 4 beacon paths.

Also suggest you read KPC3.TXT that is part of the readme directory that comes with APR

Hope that this helps you out.... have fun.... it's a HOBBY

422. Long Island Maps and mkmaphk1 notes

From: w2g3z fj@unix.asb.com (bob)
Date: Mon, 20 Nov 1995 19:36:56 -0500
To: aprssig@tapr.org
Message-ID: <199511210139.TAA07145@UNiX.asb.com>
Rendered body type: text/plain

To all fellow APRS'ers

I have finally had time, since moving to Long Island, to do some
mapmaking. Thanks to the mkmaphk1 program I have mapped all of LI
with 5mile range maps and the immediate area around my home QTH
(Sayville) with 1 mile maps. I have uploaded these to the tapr site
as limaps.zip. I have also included this file as a readme and
maplist.lil. There are not as many labels as I would have liked, I
will continue to revise them and add labels as time permits. I figured
that if you're interested in a particular area you could always add
labels yourself!

I still see some messages on the sig regarding how to make
maps using mkmaphk1 and I have written a 'step-by-step' account of how I
do it. Hope it helps someone. By the way, I only use the CDRom, I agree
with Bob, APR that its much less hassle than trying to get the files by ftp!

=====

1. Make a directory on your hd with nothing in it e.g. d:\aprs\dlg, to hold
the extracted files.

2. Use the USGS extract program and follow the instructions on screen to
extract the files for the area you need. Note, this may take many megabytes
of disc space (typically ~30Mb for the areas I've been doing).

3. Make a directory containing mapfix68.exe and mkmaphk1.exe e.g. d:\aprs\usgs

4. Run mkmaphk1

5. Enter the path to the CDRom files. d:\aprs\dlg

6. Enter the file name for your map with no extension. I use a system like
this:-

AABCCDEE

where AA=two letter ident for area e.g. 'li'
B=last digit of latitude e.g. '0' for 40 deg
CC=minutes of latitude e.g. '34' for 34 minutes
D=last digit of longitude e.g. '3' for 73 deg
EE=minutes of longitude e.g. '14' for 14 minutes

so a typical file name would be li034314 meaning a map based upon a center
of 40 deg 34' and 73 deg 14'. All of the files in limaps.zip are based upon
this
system, where li=5 mile maps and ll=1mile maps.

7. Enter the latitude of the maps center. e.g. 40,34

8. Enter the longitude of the maps center. e.g. 73,14

9. Enter the range with/without a modifier (+/-). I've found that 5mile range maps on LI can be made with -5 and down to -3 when in the city. No modifier and + selections cause the program to crash with too much detail. I have made 1 mile range maps using 1.2, this shows all side roads.

10. Wait while the program does its stuff and draws the maps on the screen. This takes a few minutes on my DX2-66 with Windows 95. Watch out when it links the map. I have found that mkmapk1 sometimes misses features in its final step. When it presents the option to 'press any key to see how the map appears in aprs' watch carefully! Especially with 1 mile maps the final smoothing process can sometimes go awry! You may find that all of your smooth radii turn into triangles. If this happens don't panic! Press any key again and get back to the dos prompt. NOTE: If you want to run mkmapk1 again with the same file name to try a different range etc then make sure you delete the previous files AND the temp file as I have found that if you don't you can confuse it!

11. Run mapfix68

12. Load the file you have just generated, if the smoothing went screwy then enter the filename as name.dat instead of name.map. This will load the unsmoothed version.

13. Enter alt-S to smooth the file, select 1.2.

14. When it finishes look out for any strangeness, e.g. diagonal lines across the map. These usually originate at 0,-1 co-ordinates and arise from single line items in the map file. If you find one, move the cursor to close to the end of the line (usually near 0,-1) type 'F' to find the point and alt-D to delete it. (This usually fixes it, if it doesn't you may have to edit the mapfile using a text editor and search for single items and delete them.)

15. Add any labels you want, move the cursor to the location, type alt-L enter the name and range you want it to appear. I have noticed that in my copy of mapfix68 this doesn't always work first time, sometimes I have to do it twice, maybe a bug?

16. Type ctrl-S to save the file and exit mapfix68.

17. Using a text editor, create a new maplist. I use maplist.zfj for most of my experimentation rather than messing up the distro maplist. Place your new map entry after the next larger scale map for that area and before any smaller scale maps. For example in maplist.li the 5 mile maps appear after usaeast.map and before any 1 mile maps covering the same area. Set the range so that the maps appear when they should, try setting it to 6 for the 5 mile maps. Examine maplist.li1 as an example and read Bob, APR's notes on this.

18. Run aprs, enter M (for map menu) and C (to change maplist), enter your new maplists extension. Zoom into your new map and try it out!

=====

I hope this helps someone, if you need any more advice feel free to drop me a line at w2g3zfj@unix.asb.com.

I also have several maps that I have digitised of the St Pete area in Florida and of North West England and Liverpool if anyone is interested.

If you need a small map of your location and its on my CD ROM then I don't mind helping out but don't expect millions of maps!!

Nuh Uhh!

it is tapr/SIG/aprssig/upload

the SIG in capitals is important. Someone wasn't thinking when he created that directory.. or maybe he was.

And just in case you didn't know- I think it wants the anonymous login to have your email address as the password.

Somebody typed (and the mail list echoed):

```
>Just set FTP server to      ftp.tapr.org
>go to the .... sig/aprssig/upload directory
>and ftp your file
>make shure you upload it in BINARY mode !!!!!
```

I'm now expert, but I (now) have 2 KPC-3's

I would think you would need to connect to the KPC via the remote command (the command that lets you change *anything*), not the PBBS. Remote access is just like a direct hardwire connection to a computer, only via radio.

No, there is a way.. I have done it using the PBBS.. Holds a user settable amount of Track lines from the GPS.

Neat way to see where a Stand alone tracker has been when it was out of range.

```

We have several KPC3s on mountain tops acting as NODES and WIDES for APRS. We would like to add UltimeerIIs to operate remotely but need some help.

The WX.TXT says that it would be easy with PACCOMM TNC to set up remotely. Ours are the KPC3 but they are version 6 with GPS capability so can I still do it. (how??)

If not then the readme file talks about OTHER TNCs that could be queried. But I don't understand the first instruction, "Install a data switch so that U-II data is only input to the TNC when the TNC is connected by either wiring to the CONNECTED LED of to the DCD line if implemented." Exactly how do I connect things??

Also, if we set this up to operate for weather, will it mess us up when we use the nodes in regular packet rather than APRS??

Any help/advice would be appreciated.

-- [From: * EMC.Ver #2.5.02] --

Refer to ARRL Amateur Radio Handbook. Mine is 94 version on page 14-2,3.

Get USGS topo map of site.
Take site, extend 8 radials from it at multiples of 45deg (0,45,90,135,180..315). Go out 10 miles.
Determine from USGS topo map terrain elevation on each radial for each 2 miles to the 10 mile extent.
You will end up with 40 numbers. 8 radials with 5 elevations for each radial.
Divide the 40 numbers by 40. You will get the average terrain (AT) within a ten mile circle.
HAAT= MSL elevation of tower base + Antenna Height (Center of Radiation) - AT
ie: HAAT = 774' + 180' - 826.4 = 127.5' which is HAAT of WA9CJN-15
I hope that's right.

APR REPLY: Just set up the KPC3 GPSTEXT stuff to look for a single # (or
) depending on which one your U-II outputs instead of the usual \$GPGGA
kind of thing that it normally looks for in GPS mode. The U-II beings
with a # (or a *) and just like for GPS, the TNC will put the WX report
in the LText buffer for transmission at a rate you specify. Thats it...
Oh yes, put the usual POSIT in the BText and be sure to use the underline
character for the SYMBOL character...

I think (No i know your right Bob) there's something wrong with uploading to
Tapr. It said that i tranferred a 1.3 meg file in 4.4sec you talk about speed!.
But then again it realy didn't transfer anything hi. Tapr should have stuck to
the old software, if it ain't broke don't fix it...

To: aprssig@tapr.org
Message-ID: <199511210601.BAA29264@borg.mindspring.com>
Rendered body type: text/plain

Thanks to all who sent answers.

Several of you sent suggestions that I should be logging into the remote
sysop address for the TNC instead of the PBBS.
That was not the problem, the PBBS is the correct way, per the docs.
(and Robert Winingham - I have the Kantronics docs here- to answer the

question you put in the help file: anyone can see the buffer unless SYSOP was specified on setup. Then only someone with those privs can see it)

Robert Winingham wrote the notes that are reprinted in the KPC3.TXT file that is now distributed on APRS. He also re posted it here. He was correctly telling me to access the PBBS and type LTRACK n, where n is the number of lines I wish to see from the buffer. The Kantronics docs are WRONG! They only indicate that n is used when setting it up and telling it how many K of RAM to use for the buffer.

The only place I could find it mentioned in Kantronics Docs is on page 9 of the Feb 16th Version 6.0 addendum, and they did a poor job of it there.

Thanks again, all.

Northern Illinois Ladies and Gents:

I have been talking to our local repeater guys who are thinking of relocating their repeater antenna to a village water tower about 178 ft AGL in the Hanover Park, IL site. They do not have a problem with the idea of putting up some extra hardline and antenna for APRS. I was thinking of a KPC-3 and MFJ Data Radio for a new WIDE.

If you are in the local area, your comments are appreciated. Of course, this contraption will be coordinated by those who coordinate such matters. I think that the site will put the antenna about 1000 MSL.

It should fill in the gap between the WIDE in Chicago and the WIDE to the West of Hanover Park. The approximate coordinates are 4201N 8810W.

I have passed this message along to lee. I haven't had any problems uploading to the system since we brought it back up.

While doing this message I just shelled out -- did an anonymous ftp to the AOPRS upload are -- uploaded a file and read it. Not one problem.

As for the change -- it was broke -- you just didn't see it :) although you probably did have it affect you.

Cheers - Greg, WD5IVD

442. MFJ DATA RADIO

From: Joseph Hussey <jhussey@freenet.columbus.oh.us>
Date: Tue, 21 Nov 1995 06:00:06 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.3.07.9511210606.A6781-9100000@acme>
Rendered body type: text/plain

A few months ago someone on this sig stated they had purchased several of the MFJ data radio's. Can someone give a report as to how they have been working. I thought the individual was going to put up a string of digis. Thinking of making a purchase - to be used at home, in a standalone tracker and in service as a digi.

Anyone care to comment.

de Joe W8RIK

APR REPLY. I bought 5 and have two hooked up. They seem to be just
fine. We used them at the marine corps marathon in a tent full of other
HAM communicators and they were clean. They ARE NOT at digi sites yet,
but I am pleased. Remember you MUST use a TNC with software DCD,
however, since there is no squelch. Although they quoted me a price of
\$119 for the radio and \$14 more for being tuned up on 145.79, The ad I
saw in QST was a little more for the 145.79 option... I havent measured
power out, but I have heard that the 5 watts is a maximum at 13.8 and
there is no VSWR protection...

447. Sony Navigator / Trimble Locator 110

From: CCVFS.DRAWING@capital.ge.com
Date: Tue, 21 Nov 1995 10:48:06 -0500

Message-ID: <0013800001313810000002*@MHS>
Rendered body type: text/plain

I'm sure these are not brand new products but I was wondering if
anyone has used either of these?

Sony Navigator. For those who have not seen it, it has a screen
that's looks to be about 3x3. It has a remote located GPS patch
antenna and a CD player. The CD's cost \$150.00 each if you are a
subscriber to the service and the unit itself runs about \$3000.00.

I'm currently awaiting a data sheet and I have also asked for a copy
of the spec's from the manual. The local mobile electronics place
here only has 2 in stock and they are located in other stores.

Has anyone used or played with this unit? Looks very interesting.

The other neat thing I saw this weekend was the Trimble Locator 110.
This is a GPS unit the size of a mouse. It's self powered and was
designed to work with the Apple Newton. From the picture it appears
to have the Mac serial port connector on the end of the data cable.
The ad doesn't state that it's anything more than just a GPS receiver.
I called Trimble this morning and requested information and pricing.

Has anyone used this unit?

Please respond to me at ccvfs.drawing@capital.ge.com if you have any knowledge of these products.

Thanks,
Dana

448. MFJ Data Radio

Rendered body type: text/plain

Joseph Hussey asked about the radios and Bob Bruninga replied, in part:
"Remember you MUST use a TNC with software DCD, however, since there is o squelch."

I'd like to comment that the TNC needs to be able to operate with an unsquelched radio, but the method of accommodating this (hardware or software) isn't germane.

Rendered body type: text/plain

Aloha de Dave in Hawaii. I purchased a MFJ-8621 data radio, and after some initial probs with frequency adjustment, all is working well. I bought mine from MFJ with 145.79 installed, and the 145.01 xtals came with the package, along with a cable with one end installed with the DIN-5 plug for the radio. For optimum use, 13.8 volts is required, but 12v works just fine. The radio is near the footprint of a KPC-3, and I have the two lashed together (w/no RF prob as far as I can tell) and stuck in the trunk, as a standalone tracker of the wife's car (I don't have a car, take zodiac rubber boat to work). I'm very happy with my unit. Aloha - now back to the beach.

455. 100K Maps

From: ke4eer@ro.com (William Nolle)
Date: Tue, 21 Nov 1995 23:17:54
To: aprssig@tapr.org
Message-ID: <199511220624.AAA02321@sh1.ro.com>
Rendered body type: text/plain

I'm doing the whole county of Madison Alabama (Yes the WHOLE COUNTY). it will take 256 maps, i have 80 done so far but i'm finding the problem now that several of the users where talking about that the software is missing a whole lot of the watr edges. The Madison County Alabama area has a lot of waterways and i see about 20 percent of one side of the waterway missing. That is really bad for an area like i'm doing. So just wanted to let you know that if your in an area that has lot's of lakes or waterways be prepared to do without many of those features. It looks mostly like it is missing one side of of a river or lake. I'm doing this in 1 mile maps, i suppose thinking about it now i could have done some of the area in 2 or even 4 mile maps but i find it's easy this way since i program my keyboard to enter the coordinates. When this huge job is done Alabama will have 476 maps, got to fill up Keith's CD somehow Hi.

Message-ID: <951122021955_30500210@emout06.mail.aol.com>
Rendered body type: text/plain

Where do you get them?

I suppose that depends upon where you live and what you have access to. XLR connectors are made by many mfgr's and available from any electronics stores that stock audio connectors. Start with Radio Shack. If they don't stock them (I know they have XLR-3's, but not sure about anything larger), go to a catalog like Digi-Key, Newark, etc. They're made by Amphenol, Neutrix, and many others.

Good Luck, Jeff - WA6EQU

Hi Bill

Yes I agree, I noticed it when doing the Long Island maps. It seems to be a problem with mkmapk1, as the water boundaries appear to be there when the map is drawn on the screen but the program doesn't link them i.e. they don't turn to white.

You have to remember that it is a just a number.

1.36 on currency exchange. 8% duty (amateur equipment is duty free) to bring
it across the border and then you have to add the local taxes.

ie: your dollar is worth 1.36 up here.

cheers...mike

Hi Ron,
Actually it not a bad price. The units come into Canada via UPS and it
costs \$42.50 to clear each parcel through UPS. So, it's not that they
are making \$60 extra profit, it just costs more to get them here. Garmin

will only send them via UPS, so you can't get them here any cheaper unless you buy 10 at time so:

US E & B price \$289
Exchange 1.38 \$398.83 Can \$
Brokerage+42.50 \$441.32
GST +30.89 \$472.21

I agree it is a little more expensive, but you know have a unit supported by a Canadian Dealer, so it's not that bad.

cheers...mike

APR REPLY: Yes, jack Admits that the software has a problem finding LONG features with lots of points that begin and end outside the selected area... Usually only rivers and streams are affected...

Hi all,

When I have to include streams and water bodies into a 100K map, sometimes I'll make a map of the water in an area with the USGS2MAP.BAS from 2Mil.GRA, and import it into the 100K map. IF the 100K map has the points to spare. Streams and waterbodies seem to take a LOT of them.

Hi-

We did this discussion already.
They agreed to charge a bit more, but it beats the \$30 + they wanted before.
They get the .01 xtals for a very low cost due to the quantity, the .79 is
still not
really that popular.

It may be easier to find DIN connectors.
The 7 or 8 pin inline DIN socket has 4 pins that fit perfectly.
The key doesn't quite stick out far enough. Might be a good idea to fill
the unused holes with
something to keep yourself from accidentally rotating the plug and plugging
it in
If you were at the APRS eyeball in Dayton, I showed this connector.

Welcome to the real world of electronic mail...:-)

E-mail is not recorded in any particular order within the mail subsystem.
Some mail viewers will order and organize it based on subject line and time
received, header date and time, sender, simple time received, etc. Because of
the disconnected nature (in some senses) of TCP/IP and the routing of e-mail,
it's very possible that you do not receive e-mail "sequentially." As usage
increases on a system, it's more and more likely that it will have trouble
handing mail off to one host or replay point or another.

It's no big thing.

Look for someone who stocks CANNON plugs, I think SWITCHCRAFT marketed the Cannon line of plugs. These were the most popular brand 10 years ago when I worked in the electronic parts industry. Very popular but VERY expensive, XLR's were used in most all audio applications in the music, public address, and broadcast industry. Good thing is that it took a Mack truck to damage these things, very well built!

Yes, I have four of these radios. They are the Kantronics DVR 2-2. Power out at 13 volts is about 4 watts, although the specs say 2 watts. I have one that has been in continous operation for 5 years, no problems. Others are in more-or-less continous opeation.

They are 9600 baud ready and I have one that runs at 9600 baud all the time. No mods are needed to use them at 9600 baud. The only problem with them is the rather open front end on the rcvr. If you are where there is a lot of intermod potential, they are susceptible. I have put a helical resonator in the front end of one where i have that problem.

Summary--a good, reliable, inexpensive, radio for packet. (I have never tried one on voice, although they will do that too with proper xtals. (You should be able to get used ones fro 80-\$100. Kantronics doesn't make they anymore.

I need help, please, in locating the 100K DLG files for Erie County, PA. I grabbed eight Road (RDF) files, 1 through 8, but they only give me details for land area north of 42 degrees lat and west of 80 degree long. That leaves a big portion of Erie County out. Who can direct me to the remainder of my county? Then next onto the state. I figure I can do PA with 13000-odd 1-mile

maps. :-)

Also, I put boundary (BDF) and railroad (RDF) DLG files in the same directory with the RDF files, but I get no boundaries or railroads. I'd like to mix in a litte water, too. What's happening?

Thanks for reading

Hi Tony:

Jim here in the Oak Ridge, Tn. area. I don't see to many on the SIG group from Pa. I lived in Erie, back in 1942, have been back there once, and it has changed a little. I'm originally from over near Williamsport, Pa. I have been looking for someone that might be making an APRS map for Jersey Shore>
>Which is s mall town just west of Williamsport and East of Loch Haven on Rt. 220. If you know someone who can make me one, I'll reimburse them for for time and trouble.
I'd like to have a street map for Jersey Shore at maybe a 1 ot 2 mile range. Town only has about 5000 folks in it. Any suggestions? I just dont make maps.

Date: Thu, 23 Nov 1995 11:40:22 -5
To: aprssig@tapr.org
Message-ID: <199511231639.LAA17310@epix.net>
Rendered body type: text/plain

Well I haven't seen any maps from Pennsylvania yet so I thought I would get started with the east side of the state. I live in Scranton, PA so naturally I'll start there.

OK...my question. I DL'ed the sr3.rdf0*.opt.gz maps for Scranton. Renamed them sr3rdf0*.gz for DOS handling. When I try to GZIP -d them my system locks up. I have tried in both DOS and Windows to do this, I even tried to just list the license agreement for GZIP with gzip -L. Even when I do this I lock up. The format I am attempting to use is gzip -d sr3rdf01.gz. Is this correct? BTW...I thought there may have been a problem with the GZIP program so I DL'ed it a second time, it does the same thing. I also tried (for the heck of it) the program called gzip386.exe. This runs some "ascii" looking characters across the screen for a while then it locks up the system. I have the gzip docs in front of me...seem to be doing things right but not having much luck...suggestions?...help?...anyone.

Hoping to contribute to the map files..thanks..Bernie WM3L

OK...found the problem. My copy of GZIP was corrupt. I DL'ed it again and it came down as 39Kb, the original one I tried to use showed 42Kb. Why that was I don't know but everything is working fine now.

Now for something completely different! I DL'ed 8 maps (Quads) for the Scranton area. My question is...Is there a way to determine the boundaries of the Quads combined? The way I see it, is, using the center of Scranton coordinate I would cover an area 1 degree N to S and 30 minutes E to W. Is this correct? If not, could someone explain the layout to me. Thanks.

Hope to be pumping out maps of PA real soon...Bernie WM3L

483. 100K maps

From: ke4eer@ro.com (William Nolle)
Date: Fri, 24 Nov 1995 00:02:18
To: aprssig@tapr.org
Message-ID: <199511240708.BAA22561@sh1.ro.com>
Rendered body type: text/plain

I found some more problems with making the 100K maps using the new MKMAP program. It depends from what part of the CD you select data from. I just wanted to start a map system for Knoxville and found that using the - for less detail doesn't work on all data from the USGS CD-ROM. I noticed this several times before but figured I had just hit the wrong key, but this time I found the following results.

Using: a -10 (Locked up my computer)

- The minus key did not have an effect on the amount of detail in the map hence the reason for all the lockups, just trying for too much detail will lock up your computer and on some data from the CD you will have no choice at all. That's bad because this means there is no way to make a single 4 mile map and up in some city's selected. Also Memory didn't seem to have an effect on any of the mapmaking either, but i now know the number of files in the data directory does, but in this case i only had the files for Knoxville. Just figured the mapbuilders would like to know what your up against. and don't have to blame your system either Hi.

484. KPC3 & U-II ??

Still having trouble hooking up the Ultimeter-II to KPC3 to do weather remotely. I can't seem to get any data from the U-II. The cable works fine into the computer with APRS WX but in spite of setting GPSHEAD to * or #, the LTEXT never changes when I use the same cable and a gender changer into the tnc.

Does anyone have any suggestions?

Use a NULL Modem Cable or adaptor.. That will cure your trouble.

Sam.

487. Map Making, DLG Internet Data ?

Subject: Map Making, DLG Internet Data ?
Reply-to: cdavidso@neocomm.net
Priority: normal

Hello I have made a few maps from the DLG data I got off the internet at FTP site edcftp.cr.usgs.gov . You may also use your WEB browser and open location ftp://edcftp.cr.usgs.gov/pub/DLG/100K/ . The data is listed by cities, Has anyone found the DLG data listed by Quad sheet ? This way I can look at a keymap of quads and pick the ones I want.

Rendered body type: text/plain

I have an IBM PC-jr with no HDrive and a 5.25 360K floppy.
I recently installed a 720K floppy (purchased at Shelby Hfest for \$7).
APRS runs fine on it now. I have a chopped down version of APRS on a BOOT disk, so when I have power glitches the system will reboot to APRS. Just thought I would mention the fact that the PC-jr will support a 3.5 720K floppy without any modification of hardware or software.
I used a power cable adapter from RadioShack (\$2.) and a standard ide ribbon cable.

P.S. the PC-jr will not support a 3.5 HD drive without purchasing additional hardware support.

Rendered body type: text/plain

I'm no expert but I'd suggest eliminating the ".gz" suffix from the command line and see if that makes a difference. I confess that I've had my problems with gzip also. The most annoying is that, if the compressed file was named filename and without an extension and it contained only a single file of the same name, the thing unzipped the file and overwrote itself. I've spent many confusing moments considering that one.

A further issue I noted is that sometimes I've found need to unzip .tar files. The syntax that worked in these instances was:

```
gzip -d <filename | tar
```

> maps. :-)
```

Are you using the WWW graphical interface? If so, have it grab the maps that are more appropriate for you. If you've questions, tell me your central Lat/Lon and I'll see which files you need to grab. I have found the graphical interface real useful especially late in the day, when I want the maps, but can no longer cerebrate:-)

```
> Also, I put boundary (BDF) and railroad (RDF) DLG files in the same directory  
> with the RDF files, but I get no boundaries or railroads. I'd like to mix in  
> a litte water, too. What's happening?
```

Looks to me like you'll have to go back to conv100x and the like to do that. I'm afraid it will be a manual issue, although with practice that becomes less onerous, in my opinion.

Drop me e-mail (n5jxs@tamu.edu) and I'll take this off-line and try to help.

491. RE: [APRSSIG:4606] KPC3 & U-II ??

What you need to use is a NULL MODEM adapter... not just a gender changer.

Larry Griffin <largriff@onramp.net>

From: Ann Reeves[SMTP:annr@comtch.iewa.com]
Sent: Thursday, November 23, 1995 10:34 PM
To: aprssig@tapr.org
Subject: [APRSSIG:4606] KPC3 & U-II ??

Still having trouble hooking up the Ultimeter-II to KPC3 to do weather remotely. I can't seem to get any data from the U-II. The cable works fine into the computer with APRS WX but in spite of setting GPSHEAD to * or #, the LTEXT never changes when I use the same cable and a gender changer into the tnc.

I've set the INTERFACE to GPS, checked the gender changer and tried every baud rate from 300 to 9600. (I wonder what the baud rate really is, I've tried reading the U-II data straight into the computer with PC-TALK4 but it looks like a MESS)

Does anyone have any suggestions?

Ann WA7ROS & Jim WA7RVV

Now that the Federal Government employees are back from their paid vacation, my USGS CD order has been submitted (I guess someone replaced the paper in the FAX machine).

I was preparing to make more Georgia/Atlanta maps and had decided to grid up some kind of paper map to help me visualize the areas involved. I was down in the shack when I went into my ATV studio and noticed the map I use as a backdrop.

It is a map I picked up from the USGS several years ago, called "Greater Atlanta Region". It always impressed me because it was like a Topo map, but covered a much larger area, sort of like 40-50 topos. It had street outlines and other features, too. Looking at the legend, I noticed that it was a 100,000:1 map!

Last night I laid the map out on a large table (the map is about 4' x 6') and began gridding it by using the little + marks on the map. I quickly found out that the map is divided into sections that appear to match the 7 1/2 minute and 15 minute sections in the USGS 100k files. Now, I have a paper visual reference of exactly what would be shown on any 100k maps I do. I work a lot better if I can see what I am working from, for some reason trying to figure out lat/long positions and visualize where they relate to other positions is not my forte'.

I bring this up because of the excellent tool that they appear to be. the Map store told me these were sort of experimental and that only about 8-12 regions were covered. If you are lucky enough to live in a covered area, you owe it to yourself to have one. Even if you don't make maps- this is a cool thing to have just hanging on your wall. It covers an area 1 degree high by 2.5 degrees wide.

I too noticed that the - key was acting funny in the program. I DID NOT have the lockups you did so I did not venture into what was going on that much. I just thought that since we have MANY MANY little streets that even with "-" it was too many points and kept on reducing the radius till it worked. If I did not reduce thadius when the program when thru it's chaining I got a lot of segmented lines.

Well many have complained of problems making maps, I was lucky 1 problem at the begining and the rest has been a piece of cake so far. My problem is with the maplist files, no one seems to have a problem with this except for me.

I put the maps in descending order and have the correct map centers entered but more often than not I cannot get APRS to recognize that a map is there. Can anyone explain what I am doing wrong ??? Some of my maps do come up correctly so I know that I do have an idea of how to do it but it is not working for all of the maps.

Thought you all might like to know that there are available index maps from USGS. These are hard copy maps by State that show the outline and Quad name of each 7.5 or 15 min Quad covering an area of the state. I had mentioned to a few people (but not here on the SIG) a year or so ago that the easiest way to track what areas had been mapped by others and a way to coordinate map making between all would be to make maps mirror the 7.5 minute quads. If you look at the proper map range in APRS while displaying the Grid Squares, they correspond to the 7.5 and 15 minute quads.

If more then one person is working on mapping a state or large region of a state, following the 7.5 quads size would insure that areas are not done twice and using the 7.5 minute quad names would eliminate duplicate naming of maps. Quad maps are named for a significant feature or population center on the map, making them easy to identify.

I have not done much in the way of making maps except for some very localized stuff for ARES/RACES work, but I think this would be a logical way to proceed. With it being easier now to construct maps from USGS data, some form of national standard for map size/coverage area would be good to establish. Custom maps for special uses could still be created and used of course. I believe that using this method would help eliminate map hierarchy problems in MAPLIST.xxx also.

Don't worry...you're not alone there. Although I've gotten good results with the MKMAPLIST.BAS program. Just redo the map order as you would zoom into them, and don't forget to add the preface to the file, and it should work for you. Just have all your new maps in one directory with the MKMAPLIST.BAS program.

I had that same thought. Since there is so much activity, we need to establish a guideline to follow to maintain consistency. I'm still new enough to admit I'm not sure what that guideline should be but maybe Bob or some of the map gurus could suggest something. I realize a lot will depend on the density of a particular area, but this could be taken into consideration.

The baud rate is 2400. Do you set INTERFACE GPS, and then toggle the power to the TNC? One last thing to try would be a null modem, since you are connecting two items designed to connect to the computer, the RS-232 lines are crossed!

I found some great "ftp by graphics" areas for just the purpose you mentioned. I don't have the short-cut marked down but you can get to it from the following.

Go to the USGS Home Page at www-nmd.usgs.gov/www/html/index.htm, then select Products, Information, and Services. Scroll down to the heading Digital Geospatial Data, choose Digital Line Graphics (DLG) from under that heading. Scroll toward the bottom of that page to the heading Product Delivery Format. Click on the <online> hypertext link. On the next page, scroll to the 1:100,000 Scale (DLG) area. Under this heading is a choice called "FTP by Graphics". Click on it. A map will come up. Click on the particular region you are interested in and a zoomed in map will appear that shows a collection on quad areas. By clicking on the area you want, you will be taken to that ftp site...the rest is easy.

The quad layout for those interested is:

Hope this helps...Bernie WM3L berlyn@epix.net

I don't understand what the problem is here. Mine are working just great and everyone that is using my maps for Alabama are very happy with the layout!. I now have 239 maps for Alabama all the way from a map of Alabama all the way down to street level in many city's and towns. If your saying they should be kept to a certain range that would be imposible. Mine work very smoothly just the way they are (Don't fix it if it ain't broke Hi). I use 4 maplists to give a lot of flexibility on how a user wan't his maps to come up. Even have one that will only bring up all the maps just related to our state. And by the way the easy way to find how to add another city is to look at the list, pick the town name and coordinates and your on the way, no problems at all. I have posted the address for Tiger maps where these lists are available for free. The list covers nearly every city and town in the country and it's Lon.Lat. If you need the list i can probably attach it to an e-mail message to you for your state.

Thanks to each of you who responded to my search for help last night on hooking up the U-II to run remotely. It now works fine!

The problem had a 2 part solution - running at 2400 baud AND using a null modem adapter. I had done both but not at the SAME time. We now have a REAL cable made without extra adapters. Incidentally, we found out that one of our U-II uses * and the other one #.

Tnx again, Ann WA7R05

504. More TAPR Trouble?

Hi group,
I've been having trouble downloading large files from ftp.tapr.org. I've been trying to get APRTRAK, but the download never finishes, and shows no signs that the download is progressing (i.e. AOL never asks me for a filename). Small files seem to work OK, however. Am I just not waiting long enough (it's an estimated 9 minute download), or are others seeing similar behavior?

Thanks for the help,

505. Re: [APRSSIG:4623] Re: Regional USGS maps/map indexes

Bill...I'm not suggesting anything be changed or implying anything is wrong with the great job you and the others are doing. Sorry if it sounded that way! Being new as I am to map making, I just thought there may be a particular format for producing the maps that will lend itself to smooth flow when zooming or jumping from one map to another.

Maybe for neophytes such as myself you can give some hints and helps about how you went about setting up the layering and adjoining of the maps you created.

Thanks for your help...Bernie WM3L berlyn@epix.net

Subject: Instructions to Mass Purchase GPS Boards
From: lver@ksu.ksu.edu (Lloyd Paul Verhage)
Date: 22 Nov 1995 17:23:43 -0600

If you'd like to get in on the mass buy of Garmin GPS boards, please do the following.

send email to the following address
maiser@humec.ksu.edu

In the body of your letter enter

sub gps "your email address"

I've set up this listserv so we can all communicate.
I got the documentation from Garmin, when you subscribe, you'll be sent a copy that I typed up.

The boards run from \$125 to \$599.

What I'll ask after we know how many want to purchase is the following.

A check or maony order for your board (I think I'd like M0 better)
A label with your address to send the board to.
Money for the padded envelope and postage (S&H).
(The boards are suppose to come in a small box, so we should be able to drop them into a padded envelope)

I'll talk to the post office on Friday and let you know the S&H.

Also, let me know what questions you have for Garmin. I'd like to get a list together the next time I call them. I'd like all concerns addressed before the purchase.

I think there's already enough interest. So this should work out better than the Motorola attempt last year.

You can contact me a verhage@humec.ksu.edu

Let's get this thing rolling.
(let me guess what will beunder your Christmas tree this year)

> explain the layout to me. Thanks.

Look, with a DECENT text editor, at the first 9-10 lines of the DLG file after you unblocked it. You'll see the NE, NW, SE, and SW corners shown in degrees, minutes and seconds. And, it sounds like you got the whole area.

You're either right, or you're wrong. IF you do not specify a file, it looks
 for the .gz suffix.... If you specify an entire qualified file ('wambat.' or
 'wambam.gz') it doesn't care.

Here is what you receive when subscribing to this garmin gps bulk purchase

list, so you don't need to just too see.
Look's like interesting for those who want to build custom systems (ballons,
space...?). Also note that RS232 can work at 9600 bauds.

*           About The Garmin GPS Boards                               *
*****
```

The boards we're looking at purchasing are described below. They can start
with the GPS engine, but we can add options to them. The prices quoted are
for 5 - 99 pieces, which I think we already have sufficient demand.

| UNIT P/N | COMES WITH | \$ PRICE |
|-----------|---|----------|
| GPS20-000 | MultiTrac8 sensor board only | 150 |
| GPS20-101 | GPS20 with GA28 marine ant. and 15' cable | 240 |
| GPS20-020 | GPS20 with GA27 mag mount ant. and 8' cable | 240 |
| GPS20-099 | GPS20 Eval Kit* | 499 |
| GPS25-000 | PhaseTrac12 sensor board only | 225 |
| GPS25-010 | GPS25 with GA28 | 315 |
| GPS25-020 | GPS25 with GA27 | 315 |
| GPS25-099 | GPS25 Eval Kit* | 599 |
| GPS30-000 | MultiTrac8 and ant. combo | 240 |
| GPS30-099 | GPS30 Eval Kit* | 499 |
| GPS30-100 | GPS30 PC Version with DB9 connector | 250 |
| GPS31-000 | same as above, but with threaded 1" marine ant. | 240 |
| GPS35-000 | PhaseTrac12 and ant. combo | 315 |
| GPS35-099 | GPS30 Eval Kit* | 599 |
| GPS35-100 | GPS35 PC version with DB9 connector | 325 |

* Eval Kits come with GPS engine, antenna with cables & connector,
power/data cable
with connector, NMEA monitor software & documentation. All Garmin engines come
complete with DGPS input capability, PPS timing output and lithium 3V
battery on board

A note from our Garmin rep states that for this order, he will include one
piece of
documentation for each board (normally they only send it with the Eval Kits)
ordered
at no additional cost. This documentation is copyrighted, so we don't want
to go
around photocopying it.

Further Info

PhaseTrac12: 12 parallel channel, phase tracking accuracy in the world's
smallest GPS
footprint.

MultiTrac8: Tracks and uses up to 8 satellites for accurate, reliable GPS
data at an
incredibly low 1 watt power consumption. With same footprint as PhaseTrac12
and a real
time clock, PPS timing and nonvolatile memory right on the board.

TracPac: A sure bet on Plug and Play GPS. Combines a GPS engine and
antenna in an all
weather, low profile housing that's a perfect fit for vechicle and PC
applications. Just

| | PhaseTrac12 | MultiTrac8 |

2.33"W X 3.80"L X 1.04"H
7.2 oz

 * FAQ *

1. Any altitude limitations?

Yes. The GPS engines will deactivate themselves above 50,000 feet. I'm looking into getting a non-export agreement so my board will function in a helium balloon.

I just got a new Kenwood TS-450S which is wired now to run FSK.
Problem is am I running within the band on 30m. APRS HF 30m is 10.151 but for FSK you tune to 10.149.30mhz. Wont fire it up until someone can tell me for sure that I will be within the band range.

It's not a problem on your end, i think. A couple of recent downloads I did from TAPR were just so slow, that any good sized file would take an hour. If you have a fancy FTP downloader you can watch the progress; if not you worry that nothing is happening. Not a big problem if your account is free, pricey if it's not.

Finally found a map i couldn't make using MKMAPHK. I attempted to make a
1 mile map of a portion of Atlanta Georgia and the program just discontinues
and gives me the error message Subscript ou of range at address 1D19:13B8
would someone that has the GA CD give this a try, the coordinates are
33,45.76
84,23.01
at a +1 range

Also Bob Mapfix16.exe locks up my computer with large files like 60-90K

I just wonder if it's my pc setup or what?.

Thanks for the reply Keith has changed a number of things in his program that I need to add to the Guide. The next area I'll update is the use of callbook data settings as this area is sometimes confusing.

518. Ultimeter II

From: "Tom Robertson" <tlr@mindspring.com>
Date: Sun, 26 Nov 1995 10:20:21 +0000
To: aprssig@tapr.org
Message-ID: <199511261522.KAA25500@borg.mindspring.com>
Rendered body type: text/plain

Hello All,

I seem to be having a problem using the Ultimeter II in standalone mode. I programmed * into GPSText. I set LOC with an appropriate value. I set BText to !3230.30N/08504.40W_Tom-Phenix City. Set Beacon Every to an appropriate value. Set echo off.

The TNC appears to be transmitting the appropriate Ultimeter output. The problem is that APRS is not picking up the POSIT report. If I monitor the transmitted packets from the ultimeter I see the beacon text as set above. I also monitor the LText with correct Ultimeter weather data. If I use the N command in APRS it show the weather with my call sign but doesn't display the position on the map. At the bottom of the APRS map the following is displayed when I use the N command.

```
@261002/0000.00n/00000.00w_67/000/T045/R.../(I forget the rest)
Becon @3230.30/08502.40w_Tom-Phenix City
```

Any ideas why the position will not shoe up on APRS. I monitored the data using APRs78.4b.

Thanks,

Tom

Rendered body type: text/plain

CAMAPS05.zip and CAMAP4_5.zip have been uploaded to
tapr.org:/tapr/SIG/aprssig/upload/pcmaps

CAMAPS05.ZIP contains all the California maps I have. CAMAP4_5.ZIP contains only the new maps created since CAMAP04.ZIP.

Use pkunzip -dn, with the file in your top level APRS directory. A new MAPLIST.CA will replace the old one, and the maps will be placed in your \MAPS subdirectory.

If you have any more California maps that should be added to this series, please send them to me as an attached .zip file to kswaggart@aol.com directly, not as a reply to this SIG message.

During this last orgy of map making, I made a few "minor" modifications to MKMAPHK1.BAS to tailor it for my own preferences. If someone wants to try it out, send me a message directly at kswaggart@aol.com and I'll send you MKMAPKKE.bas as an attached file.

The tweaks I made are:

1. Extracts airports from the Miscellaneous Transportation Features (MTF) files as color 14 (yellow). Airports take up very few points and often adds a prominent landmark. Unfortunately, many of the DLG files are so old (15 years + for some) that a lot of the smaller airfields have folded! These can be manually edited out with mapfix.

2. For maps of 2 miles or less, extracts streams.

3. Also for maps of 2 miles or less, adds 4 wheel drive and "other than 4 wheel drive" trails as color 8 (dark grey). This plots as a dashed line in APRS as has been used for railroads, which I haven't been including in my maps. I added these for a local Search & Rescue group, however there haven't been a lot of trails in the areas I've been extracting.

My CDROM doesn't include any "hypsography" (elevation contours) so I haven't played with extracting those. If anyone is interested in hacking the program to see how the contour maps would look, try modifying one of the CASE statements to CASE 190 and minor% = 200 and see what happens.

Rendered body type: text/plain

I believe I've missed something among the many instructions concerning using MKMAPHK1.EXE.

I've dl'd five files from edcftp.cr.usgs.gov and the www equivalent. To make them DOS compatible, they were called RDS140PT.GZ, with the number "14" adjusted to 15, 22, 23 and 24 for respectively. I unzipped each (gzip -d filename.gz) which left, in each case, ascii files called filename. I copied them to a single directory, so now I have:

```
\dlg\rds14opt  
\dlg\rds15opt  
\dlg\rds22opt  
\dlg\rds23opt  
\dlg\rds24opt
```

I copied mkmaphk1.exe to its own directory:

```
\mkmaphk\mkmaphk1.exe
```

>From \mkmaphk, I executed mkmaphk1.exe. At the prompt I indicated that the dlG files were in c:\dlG. I called my desired map name TEST. (I've tried a number of alternatives). I indicated the desired lat/long (26,18.0)/(80,18.0). Finally I tried +1 for map range. (Again, I've attempted various alternatives).

Every time I get the oops error message, complaining that there are no points within 1 miles of my map center.

Some observations:

The five dlG files completely cover the map range/center. I've noticed that the dlG files are terribly large (200k to 2000k). Does MKMAPHK1 accomodate extended memory or otherwise use overlaying within the protected mode?

I've tried to run MKMAPHK1.BAS from QBASIC and get a subscript out of bounds error in a DIM statement. Guess that won't work.

What am I missing?

1) Hi Rich - I kinda miss your newsletters
2) You are looking at what maybe the next "big" problem for maps, and that is map hierarchy (or anarchy). Using the Map Hrchy command will let you see what maps overlay what maps.
I advise people to customize their favorite maplist, and put the maps that they use the most at the bottom of maplist.
I hope that this is of some help

I've must have been sleeping somewhere - all of a sudden the 1:100,000 USGS paper maps have become a hot topic back on the SIG.

These paper maps have been around sense the late 70's and early 80's and are an extraction of information taken from the 7.5's quads that they cover. (EVERYTHING IS BASED ON THE 7.5's - but when you start to up the scale, the accuray drops).

To date - all the Ohio County maps, and Mich maps that i've done were based off of the paper maps - the IL maps were done from the CD-ROM's. I'm working on a set of maps for SE 1/4 of OHIO from the CD's (The old fashion way - CONV100c - Mapfix68 - & Defragb) and am using the paper maps to check against the computer screen.

For every "Quad" on the CD - there should be a paper map in print- These maps normally cost \$4 from the USGS or State Geological centers. (beats buying 32 7.5's at \$1.75@).

Each state should have a master map of the USGS Topo's for that state available free of charge - These master maps will also have a list of the 1:100,000 maps available, as well a any other scale maps in print. AND IT IS FREE - IF YOU CAN FIND THEM.

I have a Pk-900 and am mainly running APRS on VHF.
When I try to start APRS at 9600 it doesnt seem to run, but will work FB at 4800.
No big deal, but when I exit my regular packet prog, (PkGold) to run APRS the difference in the last baud rate conflicts and I have to do a hard reset on the TNC.
Any hint's?
Also, is there a simple way to switch ports?
I do see a band option of selecting 2bands but it doesnt seem to do anything. I have to goto COM/TNC and issue a command to sw ports.
Thanks 73 de Steve N8NYU

-- [From: * EMC.Ver #2.5.02] --

Just a suggestion...order the CD-ROM. I ordered mine from GEODATA (1-314-341-0851, 100K DLG, OPTIONAL FORMAT!!!!, see the APRS docs to find out which area applies to you. \$32 + shipping), and got it within 5 days with credit

card. A whole lot less frustrating!

Then extract, using their (USGS's) instructions, all the DLG maps for the entire quadrant you want. The DLG files will take a LOT of space.

Then put MKMAPHK1.BAS in the same directory as the DLG data. Start the MKMAPHK1.BAS program. Enter the directory the DLG data (should be the same as the MKMAPHK1 program's in). Enter name of your map. Prg will add .MAP extension. Enter lat/long (DD,MM.mm/DD,MM.mm). No leading zeros on the long here. Hmm, I wonder what the folks in Vegas do? 115,02 Longitude.

It'll ask you for a radius of the map. Enter some figure like 5 for starters. Enter. The program will examine ALL of the DLG maps to see which ones will fit within the lat/long coordinates you entered.

If you see lines forming on the screen, you're just about there. If you don't ask for more detail than the program can give, the BAS will finish up with 3 files: yourmap.MAP, yourmap.DAT and TEMP. Depending on how the prg treated the map will determine which one if any of the files you will use.

Just remember, adding .MAP to either of the two other files MAY work with MAPFIXxx.exe. And if you're trying this with Win 95, I would recommend going directly to DOS unless you're comfortable with the new file/folder format. And the faster the computer, the better. A 486 or Pentium will make it alot less frustrating.

John you say IT'S FREE IF YOU CAN FIND THEM, Yes that may be true but i had a hard time even finding a decent map of the area, and this was from a mapstore. John where do you get the idea that all this 100K maptalk has been about paper maps??. I have only seen one message that even remotely talked about a paper map. Maybe you have been missing a lot of the sig mail!, As far as that you must have been sleeping, yes i really think you have. Answer me this why do we need a paper map for every quad on my CD?. That would cost more than my computer cost me Hi. Well i must have missed something out of you message, i'm doing fine making APRS maps without a paper map. I have made 245 maps for our state and counting, and by the way initially checked the accuracy and they look very good when overlaying a GPS track!. But John like i say did i miss something?.

Yes, 10151 is a LSB freq, so it is the same as 10,149.3 FSK.

Tests show that 300 Baud FSK will be down 40 dB at the bandedge as required by the rules.

I brought up thepaper map topic when I dug up an old Greater Atlanta Region 1 x 2.5 degree map. I noticed it was marked in 7.5 min quads and was handy for visualizing where everything was in relationship to everything else.

The map store (who incidentally charges about 3.00 for the "free" index map) told me there were only about 7 or 8 areas of these "experimental" 100k maps made.

Were they blowing smoke to me, then. I think John Baum said these 100k paper maps exist for all areas.

Rendered body type: text/plain

I have run a PK-900 for several years now as a GATEWAY and there are a few things that new users to APRS must learn to so since APRS will not do it for you.

- 1) You must have the TNC in COMMAND mode, not HOST mode, it will NOT work in HOST!
- 2) Set APRS to run at a baud rate (that is TERMINAL RATE not RADIO) to whatever you normally run your other programs at. I have set a default of 9600 unless I am doing GPS operations.
- 3) to Switch from HF to VHF you must send the commands "O" "C" "T" in APRS to get to the CMD: prompt. Once there DO a JA for VHF or a J0 for HF.
- 4) If your stream is not set set it to \$7C so that it understands a | to be the correct character to look for in band changing.
- 5) Make sure that monitor is set to MON 1/1 and MCON is set to MCON 0/0 other ways will work but this is how I like it personally.
- 6) Make sure that HB is set to 300 for HF Baudrate of 300.
- 7) Make sure that your modems are set correctly! MODEM 10/3 is the correct setting.

This will get you on your way to APRS PK-900 operations for now. Some of these settings you can set in the SYSTEM files some do not like being placed there so you will need to do that yourself every time.

BTW if you leave your PK-900 on the APRS frequency AFTER you shut off the program please set your RESTORE.TNC file to MON 0/0. This will prevent your TNC from having a Comm Buffer Overflow problem while you are away.

Seems as if the interest in APRS among PK-900 users is not great enough to validate a modified version of it, or implementations of special commands so we just got to learn do things by habit for now.

I got to spend some time over TNXgiving to run a ZIP code plot against my files, and came up with the following areas that showed up with at least a handful of registered users:

| | |
|--------------|--------------------|
| New England | New Jersey |
| Maryland | Northern VA |
| Western Ohio | Cleveland |
| Detroit | Chicago |
| Atlanta | Huntsville |
| St Louis | Kansas City |
| Tampa | Miami area |
| Houston | Dallas |
| Phoenix | Los Angeles |
| San Diego | San Francisco area |
| Iowa | |

There are a few users in some other big cities, but not a critical mass, I guess, and most rural areas are bare... In general, there were no surprises.

My purpose for doing this was to see whether there were any areas of significant activity that did NOT have at least a 32 mile map of the area... None seemed obvious to me... But I did do a 32 mile map of NE Montana, since I got my first user up there...

I'm planning on participating once again in the meteor packet activity in December. I'm considering trying to use APRS this time, but I have some questions since I've only "played" with APRS and don't know all the ins and outs yet.

First, I read meteor.doc so I think I know how to get it set up in the right mode. I want to be sure I will get any "hits" properly recorded. On which screen will I see the packets? The "P" screen? Will they be date/time stamped and will I get all of them on an unregistered copy? Will they be logged to disk? In other words, I want to make sure that I don't lose data. Took me one night last time to get things set up on our club station with unfamiliar software and hardware so I didn't get the times recorded of the first few packets we received. With only one 24 hour period this time, I want things to go right!

I like the idea of seeing the station locations on the map and others around here who have been interested in my activity in the previous experiment might be suitably impressed!

Also, being in the upper midwest, I'm sort of in an interesting position considering the NE/NW/SE/SW directions for when to transmit. If I understand the documentation correctly, APRS will use the "correct" 15s portion of a minute to transmit. (How often during that period?) The correct period for me will be the first, or NE period. However, during the last shower, all the stations participating were East and ESE of here. That puts us all on at the same time. I rather think beam heading should be the more important factor for determining when to send (but I'll claim my ignorance of meteor shower propagation at this point!).

That's all for now. Thanks for any help!

EVERYONE THAT is serious about the meteor scatter test had better PRACTICE!

EVEN I dont remember what the METEORSCATTER MODE DOES!

Get a friend on the air on a TEST freq, and RUN ths software before the
big test. Here are some other replies to the following Questions:

On Sun, 26 Nov 1995, Tony Drumm wrote:

> up in the right mode. I want to be sure I will get any "hits"
> properly recorded. On which screen will I see the packets?
> The "P" screen? Will they be date/time stamped and will I get
> all of them on an unregistered copy? Will they be logged to disk?

REPLY: Yes, on the P and or L lists, but only the time of the LAST one
per station will be shown. The HEARD page will show how many p er hour
per station, but not the exact times. I think this all works for
unregistered users, up to the 1 page limit...

> participating were East and ESE of here. That puts us all on
> at the same time. I rather think beam heading should be the more
> important factor for determining when to send (but I'll claim my
> ignorance of meteor shower propagation at this point!).

REPLY: If you are going to beam to the SE, then you will have no
conflict to the south eastern states. If you are beaming more ESE
and want to hit the East states, then you should skew your clock
so that you are LISTENING during the first 15 seconds when they
are transmitting. But coordinate with other locals. If you transmit out
of sync so that you can listen IN your time block, then remember that you
are TRANSMITTING when someone else in your area may be LISTENING for a
different quadrant.

When you set up MScat mode, it asks you for a percentage. If you
enter 100% then you will transmit the full 15 seconds.

TEST IT GUYS! I dont want to hear about bugs the day after either! hi hi

I have been having similar problems with the Louisville-east data I
downloaded. I didn't have them in the Bloomington Indiana area.

It seems like the Louisville data is much more fragmented. The temp
file is intact, but when I load it into mapfix16, I see the stair-step phe-
nomenon I've seen discussed here.

For me, the subscript-out-of-range error occurs down to about the
2-mile or so map size.

541. QST Patch Antenna

Date: Mon, 27 Nov 1995 09:51:27 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.3.89.9511270920.A15198-0100000@gold.interlog.com>
Rendered body type: text/plain

I have built the QST patch antenna and have got great results, but I need
to improve the low level signals from the Horizon. With 10ft of RG-58
and a crimp on BNC connector, I get signals from with the middle (45
degree) circle that sometimes exceed the top of the graph (ie: 20 over s9)

>From this point of view, I can see that it doesn't need a preamp. Has
anyone experimented with the spacing to see how it affects the
"beamwidth"?

ideas are appreciated. Actual experimentation is even more appreciated.

Many thanks...mike

Rendered body type: text/plain

I figured it out myself: dl'd unblock.zip from ftp.tapr.org. And the
better news is that I managed to generate a 1 mile map of my qth.
MAPFIX16.EXE worked as advertised too.

But, the resulting map is missing major roads. I seem to remember
someone on the sig (Bob?) mentioning that the 100k data dl'd from
edcftp.cr.usgs.gov yielded good starting points for APRS maps. With that
in mind, I strongly agree. However the data for south Florida is dated
1987. That is virtually the stone age considering the rate of
construction which takes place here.

It was a fun exercise; I'll no doubt play with it more exploring other S.
Fl. data imbedded in the dl'd set from usgs. But I must say that if I
paid for the CDROM and found it as sparse as this dl'd data, I'd be a
very unhappy camper.

Message-ID: <951127103942_117418587@mail04.mail.aol.com>
Rendered body type: text/plain

Hello,

It was a nice surprise to see the VHF DX early on Saturday, 25 November 1995 to the north and south from Dayton, Ohio.

At one time, (aprox 0200 EST) I had stations on my screen from north of Detroit, MI south through Ohio and Kentucky. But at 0600 the stations from TN, AL and GA started to show up on my screen. WOW! This is the first time I have seen stations all along I-75 from Michigan to Georgia all on VHF. With some gateway action, a large part of I-75 looks to be covered by APRS stations.

Will I-75 be the first ALL APRS FREEWAY? I'm sure I-95 is very close too.

Looking for more APRS VHF DX,

Steve Caesar AA8JK VK4SID

Blowing smoke.

The paper maps were the bases from which the data on the CD-ROM were generated from.

To get a index map of the 7.5 & 1:100,000 available for your area, you should contact your state geological service - or division of natural resources. If not then you can contact the USGS and ask for the

"Index to topographic and other Map Coverage" booklet for your state.

The phone numbers are:

USGS - Reston Va. - 703-648-6045
USGS - Denver Co. - 303-236-5829
USGS - Rolla M. - 314-341-0851

HAPPY MAPPING

We had one opening in South FL last winter/spring that extended from NC/GA to Key West FL.along the digi paths, that was a sight to see!

As far as I-95 goes I can fill you in from NJ to FL....
As of 9/95 coverage areas follow.

Metro NYC to almost southernmost tip of NJ.
Aberdeen MD to almost Washington DC and some parts of Northern VA.
(all depends where you are many dead spots)
One very very long and quiet drive with no packets along I-95 till you reach
Central Florida.

South Melbourne area (south of the Kennedy Space Ctr.) to Central Palm Beach
County. Depending on your mobile station possibly no drops in coverage here.
South Palm Beach County (Boca Raton) well into Dade County thru all of Broward
Co. Due to the high RF in Dade County coverage varies in the Miami area, but
continues to Key West with some deadspots out in the middle of "nowhere". It is
kind of tough to set up a digi on a piece of ocean marsh that many call an
island, Flipper is not into APRS...yet! But all in all you can have most of the
Keys covered with the digi's located in Homestead, Marathon, and Big Pine Key.

All of the above is with an average mobile station eg: 50W mobile, roof mt. 5/8W
antenna.

Granted there are some areas that it will not work in but this goes for most
MOBILE DATA communication. Flutter kills our packets and so does the varying
terrain. I think that this stretch of road is the largest stretch covered by one
APRS network so far. I have not measured the distance from VA to NY compared to
Melbourne to Key West but I think the FL stretch is longer, not only that
Delaware APRS coverage is non-existent so the link is broken in that scenario.

Also I am thinking of MOBILE coverage here everyone, the coverage is quite a bit
better and much more reliable for home stations. If we speak about home stations
we go north to Titusville (Kennedy Space Center) and for an aircraft just short
of Havana! Yes it has been tried and we have actually had a APRS Tracker on 2
aircraft that did fly over Havana this past September and the one ship that was
rammed by two Cuban gun boats during a demonstration (No, not a APRS
"demonstration"! hi hi)

I also believe that Delaware home based station can make it into that APRS
corridor so their system is also quite impressive.

Anyone else have large coverage areas that you want to fill everyone in about ??

Actually, you DO NOT want to "improve" your low angle signals. There's 'way
too much ionosphere between you and the bird(s) to make them really useful.

In the urban canyon world, I run satellite masks (minimum elevations) at 15
degrees, with Motorola's "highest-in-sky" mode in effect. For general vehicle
location stuff, I run the mask at 10-15 degrees, depending on terrain. For
professional survey work, we run it at 15 degrees, then exclude up to 25
degrees by post-processing magic. For the differential base station, I
always keep the mask at 5 degrees... to make sure the base station is seeing
more than the mobiles.

If you have the mask down around 0, you're inducing system level ("common
mode") error that can be thought of as induced noise, into the solution set.
I'd be looking to keep the angles up.

I am putting in all the commas needed based on all the other entrys. Checked that
and made sure I put in a decimal instead of a comma in lat/lon. After using the
other map making programs that require a comma in that lat I thought it may have
been that, I was not lucky, it was not.

Everything is entered using an example so I am sure the entry is correct, I have
also done the same entry several times on different days to make sure I was not
overlooking a simple mistake.

As far as the comments I do insert a comma but I also always insert at least my
call as a comment.

I got ZERO response from this posting. Maybe it didnt make it out on the net... Anyone have a foot in the door??

----- Forwarded message -----

Heard a rumor that HAM radio is NOT going to be used AT ALL this year for the cross country running of the Olympic Torch. The RUMOR says that someone teamed up with Radio Shack to use bazillions of CB's. BUT THAT on-air tests (without repeaters of course) are leaving the organiziers real worried about being able to communicate on CB... over the needed distances..

TWO THINGS COME TO MIND!

1) HAM RADIO needs to waltz in and save the day

2) I cant imagine anything more FUN than putting a GPS/TNC on the OLYMPIC TOURCH CHASE VEHICLE with the path of RELAY,WIDE,WIDE,WIDE!

[Then waltz into your local TV station with your LAPTOP]
[and show them what you can do! Dress well!, Shave.]

If anyone can substantiate this rumor and can find someone in charge and suggest A GPS unit on the Olympic Tourch, I bet you would have NO PROBLEMS GETTING PACCOMM or one of the other TNC MFRS to donate the equipment! But who has their foot in the door?

AND ATLANTA IS WIRED FOR APRS!

DE WB4APR in Annapolis MD. (Not anywhere near Greatlakes)

I know this is going to get me some flames, but here it goes anyway. I wouldn't count on PacComm for anything anymore, at least i won't. I have bought several of their products and so have some friends of mine (At my suggestions) But I WILL NEVER BUY ANOTHER PACCOM AGAIN, AND I WILL NOT SUGGEST ANYONE ELSE DOES EITHER. If all you people remember about 6 month's ago i had problems interfacing my Megellan NAV-5000DX to a KPC3, Well after calling Kantronics and Magellan several times i never did get my GPS to work on a KPC3 (It won't work). Well after trying so many times i finally decided to give up, untill i received a message from GWYN at Paccom and they offered to trade me a PicoPacket for my KPC3 just to be nice and help me out (they said they realy didn't want the KPC3) but wanted to get me going with the standalone tracker using the Magellan. Well folks after many weeks went by i got excuses after excuses why i didn't receive my PicoPacket yet, The last of the messages asked my for my address cause it got lost. I send this to them, at that time i even made the statement to them if they felt that they had made a mistake that i would not feel bad at all if they backed out of the offer since that was the feeling i got since so much time had past, but they never had the the courtesy to even say no we cannot follow trough with our promise. So the result of all this is that you cannot depend on anything they say, it has now been aroud 6 month's and i have seen nothing resembling a PicoPacket. So take it for what it's worth but i will not ever recommend any Paccom product again for the simple reason that they must not be able to keep their word. THEY MADE THE OFFER I DIDN'T ASK FOR THE TRADE.

Bill KE4EER
ke4eer@ro.com

I bet you would have NO PROBLEMS GETTING PACCOMM or one of the other TNC MFRS to donate the equipment! But who has their foot in the door

Hi Gerry,

If what you say is correct (and I'm not denying it), then leave well enough

alone I guess? If this unit receives only 8 satellites, then the only time (with the current constellation) that you receive all 8 is when you get the satellites below 25 degrees.

So, to see if I understand this, my best mode of operation from a mobile who is sometimes in a tell urban environment is to look from about 25 degrees and up for the strongest signals? I managed to improve the low level signals by inserting a vertical component approximately 1/4 wave at the feed point.

This immediately helped, but, based on the above statement, might actually give me a signal with less accuracy? (would this be the reason I sometimes see "jogs" in my track perpendicular to my travel, or is this from the dialed in error?)

It sounds like you've done a lot more research on this than most. I did find that I did loose lock a little more often than when I had the external antenna stuck on top of the car at the end of a piece of RG-174.

Many thanks for the reply, as I am glad to understand more about it.

cheers...mike

-- [From: * EMC.Ver #2.5.02] --

FYI, for over a year now, I have tried to listen to the IL Wing Civil Air Patrol Chicago Area VHF Net. I was only able to copy about 15% of the transmissions because of pager, etc. noise breaking in and drowning out the weak signal. Same was true of the local ham club repeater. Even though it was a fairly strong transmitted signal, it still got overwhelmed by extraneous garbage.

Tonight, with the above mentioned bandpass filter, I was able to copy in excess of 95% of the CAP net (60+ miles away), whose xmissions don't even register on my LCD signal meter. And the local ham net came thru like gangbusters.

I guess I don't need 70 watts transmission power to HEAR well. Just a clean input. I can hit the local wide (16 mi away) with 2 watts.

Not only Atlanta but I have heard that the route will bring it thru Southern Florida right in the middle of "APRS Country". I have not verified this information but if it is true we got to find out NOW. Some temporary digi's will be needed and A LOT of coordination for an area the size of ours to GUARANTEE coverage. If enough notice is given maybe some temporary stations can be put in place as in the ARMY-NAVY operations (probably not needed anymore with all the digi's up there now) a few years ago from MD to the NYC Skyline.

Anyone have access to any of the OFFICIAL information ???

Hmmm--

I thought I replied to this already.

Your rumor about no HAM radio is just that. A rumor.

First: The commercial radio story in Atlanta

Motorola is the official Olympic radio sponsor. I was told that they had 5,000 or so radios to give
They are all promised, gone and have been for a LONG time.

There is basically no 800 Mhz analog trunking left in Atlanta. At least there will not be any by Olympic time.
It all went digital when Nextel/Dialcall/Onecomm paid big \$\$\$ to buy up all the 800 MHz and convert it to digital
cellular look alike, yes folks, We have 3 cellular carriers here. Only they call it digital trunking. But it still costs
30.00 a month and 35 cents a minute to talk on even the radio part of it.

Another option is the limited amount of available 900MHz analog trunking which Motorola
can't get to work worth a toot around here, We have these hills, you see...

Remember 220 MHz? A little used Ham band? Well how would you like to use 220-222 MHz analog trunking.
ACSB (Amplitude Compandered Side Band) We have many channels available in Atlanta. Only 50.00 per day per radio
with a commitment of either 1 or 3 months (I forget) How many would you like?

With a radio situation like this, you can darn well bet HAMS will be used. Just like we were used during the
Democratic National Convention. Even if it is only to help buses communicate.

After the Olympics were announced for Atlanta, A couple of the "old line" Ham clubs tried to get the jump
on each other by running to the Olympic Committee and trying to get designated "The Official Olympic Ham
Radio Club" and whatnot. Because of this, the ACOG (Atlanta Committee for the Olympic Games) told the Hams to take a hike.

They have had a change of heart and now want Ham help. So badly that the minimum time you have to promise has been
waived for Hams. Other volunteers have to do a lot of Pre-Olympic public service to even be considered, and even then
they have to give THREE WEEKS!

About the torch- It is not one torch, but many torchES. They switch it with each runner and the runner gets to keep his.
The tracker would have to be in a vehicle or something like that nearby. I don't know the route of have a contact with
the torch run, but could maybe ask around.

Disclaimer:

Some of this info could have changed between the time I learned it and I told y'all.

Don't know what the official route for all the Olympic activity is, but if
it comes anywhere near Dallas I'd be happy to help with it. I coordinated
much of the public service work for the Dallas Amateur Radio Club for many
years, and this looks like a good public service. Don't know the best way to
proceed at this time, however. Looks like we should have a central
coordinating point for the ham activities. Is anyone wearing that hat now?

APR REPLY: YES THE CHASE VEHICLE! In years past, it was a winnebago which went the entire route across the country! I believe the TELEphone COmpany "Pioneers" provided it, or at least manned it. All we gotta do is get a GPS unit ON IT. Everyone keep looking. Some HAM somewhere has got to know where that CHASE vehicle is. Put a tracker on it, and then FORGET about having to round up volunteers. All you gotta do is plop down a PC anywhere you want to track it.

569. GPS simultaneous parallel tracking

From: Jim DeLoach <jim.deloach@cellnet.com>

Date: Tue, 28 Nov 1995 09:12:00 -0800

To: aprssig@tapr.org

Cc: 102256.1216@compuserve.com

Message-ID: <199511281715.JAA18606@cellmail.cellnet.com>

Rendered body type: text/plain

My understanding is that simultaneous parallel tracking becomes greatly usefull when velocity is greater. I know for a fact that my Garmin GPS-75 fell apart (lost lock) at about 80 miles/hour (cruzing down the runway in my boss' aircraft), but hangs in there for me going about 65 down freeways. Since my application is for stationary & low-speed use, I don't really care.

However, I would really like to quantify the additional error from "multi-tracking" GPS receivers (like the Garmin's) for stationary or low-speed use. Has anyone done this?

Cheers.

Jim, WU0I

Hi, guys and gals (or OMs and XYLs).

I spoke to Bob briefly this morning. He is ready to distribute the ZIP code database and I volunteered to collect the data for him.

In order to see the geographic coverage of the APRSSIG, I will build an APRS backup file of everyone on the SIG for distribution. With this file, we can see who all is out there listening. Please send me a message with your ZIP code and call sign. That's all I need. And, to make it easy for me to copy the codes from my SUMMARY screen, please put the words "ZIP xxxxx CCCCCC" as the SUBJECT of your message, where xxxxx is your ZIP code and CCCCCC is your callsign.

The subject line of this message is an example of the preferred format.

I will build the database from these ZIPS and will NOT read the message. PLEASE send your ZIP message to me PERSONALLY, and NOT to the SIG. Send to:

chead@exame2.dseg.ti.com

As soon as I get these ZIPS, then we will have a backup file for everyone to see where we all are.

Personal and Corporate Flames aside, I don't understand why someone couldn't
get their KPC-3 (with the GPS firmware) to get up and running within 15 or
20 minutes.

I upgraded the KPC-3 firmware, myself, as well as adding a bigger RAM chip
about the same time I interfaced my Magellan Trailblazer XL to the TNC. All
went smoothly, and to my surprise, minutes later was seeing my raw GPS data
being decoded by APRS. Equipment used: KPC-3 TNC with version 6.0 firmware,
Magellan Trailblazer XL with version 1.0 ROM, and a Yaesu FT-51R HT. KPC-3
set to 4800 Baud, intface GPS. I followed the wiring diagrams supplied by
Magellan with their data cable and by Kantronic's user guide update. Not a
problem.

As an interesting aside, the receiving side of this setup is a 1985 AEA TAPR-2
clone (one of the originals!) and an equally ancient Icom mobile unit (I've
yet to get APRS to work in the transmit mode with this TNC, but it receives
fine).

Perhaps I can be of some assistance with people having problems with KPC-3's
and Magellans.

I cobbled the KPC-3, Magellan, and FT-51 in a small box, stuck it in my car,
and roared around the streets of Phoenix, much to the delight of fellow
APRS'ers. Tracking was dead on, and the little car icon never strayed far
from where actual streets are denoted on the Phoenix APRS map. In fact,
most of the time the car icon straddles the lines of the streets. I
couldn't ask for better results. BTW, in Phoenix we use a digital mode
repeater for much of our APRS work on 147.1(+) (although we are trying to
move to 145.79). This repeater sits on the White Tank Mountains west of
Phoenix (at about
4000 ft) and provides excellent coverage through most of the Phoenix Metro
area. I demoed this system to John, KC7JRA, at his house, and (via autopatch)
he clearly noted that I had driven from his house, east on Thunderbird Ave.,
north on I-17 to Bell Road, where I looped back around, headed south on I-17,
and was sitting somewhat north of MetroCenter, probably at the Barnes & Noble
bookstore (which is where is was). The system works, and works flawlessly.

I'm still trying to get equipment and a site to set up a dedicated 145.79 APRS
node here in Phoenix. Any help would be greatly appreciated. I recently
"lost" my digi site to our club's 2m voice repeater [145.43 (-) no PL] on
Phoenix General Hospital (I-17 and Beardsley). But it was a "marginal" site
anyway...

Rendered body type: text/plain

If I read Mike's last message correctly I guess he is using RG-174 for coax. I do not want to put my foot in my mouth but we use RG-174 at the shop with a few turns in it as an attenuator on VHF and UHF, not even SHF. I have often seen small cables on GPS antennas commercially but always assumed it was a amplified antenna, and that the cable was a strange breed that did not show as much loss as true RG-174.

I have built one of the patch antennas myself but have waited to connect it to coax for several reasons.

- 1) I am using THICK aluminum (eg: as in boom bracket material for a A3!) and this will require a LOT of heat with some tricks to solder coax to it.
- 2) I have avoided using copper tape as described since I can't find it locally
- 3) I have tried a special conducting marker used in PC Board Repair but the heat required melts the conducting ink/glue where it does not do the job.
- 4) I want to keep the feedpoint details as close to original as possible and am still thinking how/what to use to accomplish that.
- 5) Waiting for a scrap piece of teflon 800 MHz coax to be available so I can use that. Not used often at our shop, just in special projects and I can't cut it off of a new NMO mount for my project (too expensive of a mount for that!)

Co-worker built one of these and used nuts/bolts with ring terminals to connect the coax and it works. It just works, about the same as a stock integrated GPS antenna. After all the work having a friend machine my antenna plates on a mill with GRADE 1 aluminum I can't see making it a mess by trial and error and have it work just as well as my interior mounted antenna.

Any other ideas other than the tape, conductive pen, or bolts ? Looking for pop rivits (sp?) that are made of copper and leave a hole in the center. No luck yet, just copper rivits that are solid.

All Garmin GPS units unless desined for AERO use will shut down at about 90mph! I was the first one who found out the hard way! Planned a special trip with another ham firend who is a pilot, made some special outside antennas, mounted them under the wing for 2M and left for FL's first AERO APRS demo. Every time we took off the GPS would lose all data and keep searching, every time we landed and slowed down it worked! I thought it was some sort of electrical noise in the GPS band created bu the aircraft's engine at high RPM! A few days later I was told by a local ham and then GARMIN that indeed it will stop operations. When I asked why ?? they bluntly replied so that we do not kill our same model designed for the Aeronautical market! I made a few comments and and quickly hung up the phone, for someone to actually go to the effort of having a product NOT DO something is insane and I think bad reflection on the company in general.

My GPS-50 works fine but I am planning on not buying a Garmin in the future do to the above actions by Garmin. I don't do much flying anymore but just the idea... I will look at Magellan and the others from now on.

578. Interim report on ZIP code database

From: Claude 995-5040 pager 4541 <CHEAD@exame2.dseg.ti.com>
Date: Tue, 28 Nov 1995 18:09:35 -0600 (CST)
To: aprssig@tapr.org
Cc: CHEAD@exame2.dseg.ti.com
Message-ID: <951128180935.206024cf@exame2.dseg.ti.com>
Rendered body type: text/plain

Interim comments on ZIP code database:

Thanks to those who have responded so far - 49 as of the writing of this message.

PLEASE make things simple by following exactly the conventions suggested in the original request for ZIP code data:

1. Send information to me, NOT to aprssig.
E-mail address:
"chead@exame2.dseg.ti.com"
2. Put the zipcode/call information in the message SUBJECT line EXACTLY as follows:
"ZIP xxxxx CCCCCC",

not buried somewhere in the body of the message. Here "xxxxx" is your zip code and "CCCCCC" is your callsign. The preamble word "ZIP" helps to find the data.
3. If you are reporting for several hams and/or locations, please send a separate message for each one.
4. If you must put something in the body of the message to make your mail server happy, that's fine, but I'd really like to be able to get all the basic information from the SUBJECT line.
5. This allows a simple program to pull the information from the messages and format it for further processing. It gets a lot more complicated if I have to search through the whole message to find the information in an unknown format! I hope to see many hundreds (maybe thousands?) of hams report in for the APRS zipcode database and automatic processing is a lot easier than the manual search and retrieve approach.

Thanks for your response so far. Keep the data coming!!

Well this is not a Magellan trailblazer, it's a Nav-5000dx totally different ballgame believe me. A friend of mine has a Magellan Maredian it was a snap to hook it to a KPC-3, but all efforts failed that where suggested either by those on the Sig or Kantronic or Magellan!. I have to say i did get it working without any hassle on my Paccomm Tiny-2, by the way the KPC-3 had the latest firmware. And yes the Magellan had the correct output and voltage level. It would send out 1 and only 1 GPS beacon then quit updating even though the Magellan kept sending data. Anyway this is all water under the bridge. Instead of 15 or 20 minutes i spend 15 or 20 days on it hi.

How about brass, as the author suggested, to avoid the soldering problem?
Has anybody tried that, and were there any special problems?

I have not yet attempted the project and am worried about maintaining the
spatial tolerances. Are there any suggestions out there about how to cut
the plates with only basic garage tools?

My Motorola PVT 6 does great at flight speeds of 200 mph or so
My Garmin 45 did fine too, on the runway, and in flight below the 99 kt
speed limit.
Sounds like you had a poor signal or satellite geometry in that plane.

Unless I'm mistaken, any gear possibly used for air navigation has to be FAA
type accepted, and the manufacturer has to jump through all kinds of hoops to
get it approved.

I don't think they are just trying to sell a more expensive piece of gear,
it's just that the extra capabilities that a GPS has with air navigation
capabilities dictates a higher price.

If Garmin had their way, they'd probably sell all their receivers at a fair
price. Unfortunately, if it can be used in an airplane, the government and
lawyers make them jack the cost up.

I checked with the Pioneers. They did the torch run in 1984 because AT&T
sponsored the run. The 1996 Olympic torch run is being sponsored by my
Employer, Coca-Cola.
I didn't even know that !! I will check with my contacts on getting a
tracker on the 'bago.

The guy from the Pioneers did tell me that he also heard there were going to
be no Hams helping with the torch run either. I'll see about that too.

Rendered body type: text/plain

Well the 2nd generation MIM module prototype is now on the air. This is
a single chip micro about the size of a matchbox that is basically the
transmit side of a TNC. It has the same features as described in the
APRS\README\TELEMETRY.txt file but with a few more features:

- 5 analog inputs
- 8 digital bit inputs
- GPS NMEA input

- it outputs ax.25 packets (audio)
 - BEACON packet
 - APRS POSIT packet
 - TELEMETRY packet
 - CW-ID if needed

This one can be configured via a serial port in the field and it has a
NOVRAM memory for config.

DO NOT BOTHER US WITH QUESTIONS ABOUT AVAILABILITY OR ANYTHING ELSE. WE
WILL ANNOUNCE ANY developments as soon as we figure it all out. Gotta

get some boards made and debugged, docs and stuff... You will hear about it here as soon as we know!

588. E.Coast 4 alias plan

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 28 Nov 1995 23:45:39 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951128230319.24410B-100000@greatlakes>
Rendered body type: text/plain

Here is my proposal for using 4 aliases along the eastern Seaboard.
SInce this is a straight line of digipeaters, it will permit stations to digipeat out 5 hops in both directions without DUPES!

DIGIS: BWB? TFZ HDL APR1 APR11 IPH15 HOB15 JNF4 RHN15 GTT15 MNS
ALIAS1: R R R R R R R R R R R
ALIAS2: W W W W W W W W W W W
ALIAS3: NET1 NET2 NET3 NET4 NET1 NET2 NET3 NET4 NET1 NET2 NET3
ALIAS4: LNK1 LNK2 LNK3 LNK4 LNK5 LNK6 LNK1 LNK2 LNK3 LNK4 LNK5

Notice that the NET aliases repeat every 4 digis and the LNK aliases repeat every 6 digis. To see how this works, imagine you are in the vicinity of IPH15 digipeater. If you transmit via R,W,NET3,LNK3,NET2 then your packets would go all the way out to GTT in Connecticut and down south to TFZ, WITHOUT A SINGLE DUPE!

The user could even add a WIDE at the end and only have one dupe for even greater coverage!

Now a similar pattern emerges for the digis, They dont need the first RELAY, so the IPH15 digi would beacon its posit via W,NET3,LNK3,NET2,W

The newest PacComm Handipkts can have 4 aliases. With proper planning you can really take advantage of them!

For the EAST coast net, this is the plan, so if you are near one of these machines, pass this message along to the SYSOP. This is not a directive, but a far ranging plan. Think about it in your future upgrades....

PS: There is a plan for a digi in East Central PA on the mountains, (at Temple Univ) so this should be a BIG boon for us. But it is also our first major digi that is NOT in the linear line of the existing net. Once we see what all it hears, it will be a challenge to figure out how to use its aliases...

>If I read Mike's last message correctly I guess he is using RG-174 for coax. Sorry for the confusion, in one setup, I use about 6 feet of RG-174 with BNC connectors on both ends and I get good results with the Stock GPS-45 antenna up on the roof of the car. For my patch antenna, I use 8 feet of RG-58 with 95% braid

>1) I am using THICK aluminum (eg: as in boom bracket material for a A3!) and >this will require a LOT of heat with some tricks to solder coax to it

I used the cheapest tin I could find at the hardware store. 2x1ft for \$2

>2) I have avoided using copper tape as described since I can't find it locally

Didn't use it...I soldered directly

>3) I have tried a special conducting marker used in PC Board Repair but the heat >required melts the conducting ink/glue where it does not do the job

I used a 100w Iron and used steel wool saturated with oil to clean the tin. You then solder through the oil...it works.

>4) I want to keep the feedpoint details as close to original as possible and am >still thinking how/what to use to accomplish that
I cut the tin with tin snips after scripping the dimensions

I used nylon screws and made spacers for 5m out of nylon.

I get signals that exceed the top of the graph if they are in the inner circle on the display.

cheers...mike

I have been reading the sig for about six months. I down-loaded from the
usgs site the eight files that cover the macon area.
they were named mc1.rdf01.opt.gz or something similar I renamed these to
mcnrd1.gz incrementing the numeric for one through eight I then placed these
files in a directory with gunzip.exe and tried to unzip however I received a
message that the central file directory was missing. I also tried unblock.bas
without success. I don't know what to try next. Can someone on the sig list
the steps in order for making a map from this data. I have seen several
methods but they don't seem to work.

Jim,

I am responding because I also have a Garmin 75. I don't know
much (but I am trying to learn by watching the remailer).

My Garmin shows that I am traveling about .2-.6 mph while I am
PARKED! The other thing that bothers me is the altitude can move 50+ feet
while parked. This is with 5-6 satellites and an outside antenna (factory
remoted w/ RS cable.)

On a recent trip to the BOM near St. Louis I was interested to note
that the GPS was reporting 5 mph faster than the speedometer (and that was
supposed to be certified????).

Thanks for your comments - in advance.

This brings up a question: With the end of the 55 MPH speed limit and states talking about 75-80, or in the case of Montana NO daytime speed limit, what does that do to a GPS that falls asleep at 80 or so???

Just having fun in Chicago.

Sounds like the output voltages are slightly different between the Maggie Trailblazer and the 5000DX, or something of that nature, but I'm just guessing. But for those who are looking for a "no-hassle" setup the Magellan Handhelds (Meridian, Trailblazer, Trailblazer XL) and the KPC-3 are the way to go. The KPC-3 can take their inputs unbuffered, and the Magellans WILL work in aircraft or speeds above 90 knots. And considering that Pres. Clinton repealed the nat'l 55 mph speed limit yesterday, high speed autoways may be in our future soon. The state of Arizona is already erecting 75 mph signs on certain areas of our interstates! I havn't seen a 75 mph sign since I was a pup!

I would make the argument that anyone on this sig knows more about Magellan and Kantronics products than the people who answer the phones at either company. This is not a flame, it is a fact. But this seems to be a problem in every industry. I can only think of one time where a product support line has ever been able to help me, and that was INDUS (back in the old days) when I had an INDUS GT floppy drive for my C-64. They put the engineer who DESIGNED the unit on the phone.

I'm very dissapointed with Kantronics Tech support and their manuals are horrible. The last time I called, I ended up explaining APRS and GPS to them, and I made the mistake of mentioning meteor scatter. They basically refused to put me on the phone with a programmer or engineer and did a thoroughly lousy job of selling the firmware upgrade.

I did take a look at the AEA answer to the KPC-3 (the PK-12?) and was very impressed by the user manual, but after talking to the HRO guys and the people at the Phoenix PUG, it seems the KPC-3 is superior. I wish Kantronics would take a look at AEA's manual and use it as a model.

Although I don't have their address handy, the Arizona Repeater Association has a web page. If you can't find it, I'll get it for you. You should be able to get in touch with someone there who can assist you. Another good person to speak with is Dan, N7MRP, president of the Arizona Intertie Group. Again, I don't have his email address with me.

BTW the ARA is the largest repeater group in the Country (biggest membership) with 19 operating repeaters in central Arizona including FIVE open autopatches, and dues under \$20 per year. It's a fine organization, and I'm proud to be a dues paying member. Phoenix is a odd place for packet as the majority of BBS and Keyboard to Keyboard traffic is conducted via two 2m digital mode repeaters. Although we have our share of digi's and nodes, but not like San Diego, where the packet infrastructure seems to rely mostly on simplex freq's.

Hope this helps,

At one time in my life I would have agreed with you Rich. However now I recognize the difference between engineering and marketing:

Engineering generally strives to provide as many features as possible for the money. Not a bad idea from a manufacturing expense point of view.

Marketing generally strives to provide as much income as possible for the features offered. Not a bad idea from a corporate bottom line point of view.

In one of my employments I was responsible for LSI design. The chip requirements were set to accomodate all of the features desired by marketing. An additional requirement is to have the features selectable by manufacturing in accordance with the sales orders. The performance features varied with the model, and so also the price. All models of the product had the same electronics. Some of the features were inhibited according to the model number (and price).

Once a CEO told me that customers do not buy products ... they buy

features. I believe that is one of the few things that guy taught me that was true. (The other thing was that nothing ever happens until someone sells something ... not a bad axiom for an engineering manager to keep in mind).

OK, I took the initial ZIP code list provided by Calude and built a history file from it. That way you can replay it over your existing map, without destroying your current P-LIST. This very first list contained about 72 entries. 9 callsigns were rejected due to their ZIPS not being in the ZIP data base I was using. I will wait until tomorrow to put out the .HST file since it hasn't even been 24 hours yet since we first decided to do this. and ZIPS are coming in all the time.

WE ONLY WANT ZIPS OF USERS ON THE SIG. We do not want ZIPS of anything else. The purpose of this file is to be able to see geographically who is on the sig, so that we can see if there are any areas of the country that are NOT represented here.. This is just a tool so we can see if the "WORD" from the SIG has a good chance of hitting all the areas of activity.

>From the first 70 processed, there are still some big holes, so I will wait until the full list is done before distributing the ZIP-SIG.HST file tomorrow.

Here are the calls and zips that were not in the ZIP database. These stations should reply to me (APR) so I can update my ZIP database. Please provide the LAT/LONG of the CENTER of your zip code area... only to the nearest minute. Thanks

Ok, let me tell y'all about MY experience with Kantronics...

I was carrying my KPC-3 to the car and dropped it on a concrete floor. I tend to be rather clumsy sometimes. Found out that the STA and MAIL LED's were smashed, everything else worked. The KPC-3 proved to be more rugged than I thot. I called Kantronics for replacements and also to order the Ver . 6.0 firmware. The man I talked to was very nice, suggested that I could get those LED's at any Radio Shack if I wanted to. I told him it would be easier on me if I could just have it delivered. He said he'd send two no charge. I also asked about larger RAM. He again suggested that a RAM chip of a certain # would probably work just fine. But if I couldn't find it, they could gladly sell their factory part to me. It would cost more, though ..

So, my experience with Kantronics, the KPC-3, and the manual (I like it) has been positive.

Now let me tell you a horror story about MFJ....

Hi, Mike,

Mike Walker sez:

>
> If what you say is correct (and I'm not denying it), then leave well enough
> alone I guess? If this unit receives only 8 satellites, then the only time
> (with the current constellation) that you receive all 8 is when you get the
> satellites below 25 degrees.

I'd leave well enough alone. What you really want to do is optimize geometries to as many (up to 8 in your case) birds as possible while looking to minimize excessive ionospheric propagation delays. When you're in an urban canyon environment you really want to look high in the sky for this and 2 other reasons: 1) buildings make good signal blockers and there's no reasons to make your GPS receiver look for satellites that are blocked by buildings most of the time. 2) signal reflection from buildings (multipath) will really screw you up. IF the GPS receiver looks at the almanac and says, "Hmmm. SV(PRN) 14 is at 22 degrees, but PRN 31 is at 38 degrees. I think I'll use 31." it's going to run a smaller chance of seeing signals from a satellite that are multiply reflected and therefore a couple of chips late... or distorted.

> So, to see if I understand this, my best mode of operation from a mobile who is
> sometimes in a tell urban environment is to look from about 25 degrees and up
> for the strongest signals? I managed to improve the low level signals by
> inserting a vertical component approximately 1/4 wave at the feed point.

That's it. If you can tell your receiver to look for "highest in sky" or set a satellite mask angle to something pretty steep, you'll help yourself. You may have to relax your original settings to optimize performance in YOUR locale.

> This immediately helped, but, based on the above statement, might actually give
> me a signal with less accuracy? (would this be the reason I sometimes see
> "jogs" in my track perpendicular to my travel, or is this from the dialed in
> error?)

A combination of the two. It'd be hard to tell without some long baseline data and statistical calculations.

> It sounds like you've done a lot more research on this then most. I did find
> that I did loose lock a little more often then when I had the external antenna

You should be seeing them down to the horizon, plus or minus the constraints of the antenna's design. I guess I need to look at that, and get a feel for the E and H plane patterns... For an urban canyon environment, a 20-25 degree minimum elevation should work pretty well. If all you can see is >40 degrees, something's broke! put your extension back on!

David,

Sounds like your perceived problems are due to what's called selective availability or SA for short. The military can introduce an error factor into the commercial GPS signals to prevent an enemy from using cheap GPS guidance systems for smart their weapons. The random altitude error factor is the most variable due to the threat of cruise missiles coming in low to avoid radar detection. The idea is that we might be able to trick them into crashing into the dirt prior to them reaching their targets.

SA can vary depending on the world situation. During the first few days of the Bosnian peace talks our building near Wright-Patterson AFB was moving all over the map!

Hope this helps!

608. GPS Errors (was Re: GPS simultaneous parallel track)

From: Jim DeLoach <jim.deloach@cellnet.com>
Date: Wed, 29 Nov 1995 10:29:22 -0800
To: aprssig@tapr.org
Cc: dbarrow@omnifest.uwm.edu
Message-ID: <199511291833.KAA16360@cellmail.cellnet.com>
Rendered body type: text/plain

The GPS system intentionally adds some error to thwart "enemies". This is known as "selective availability" (SA), and is the bane of many a GPS application. This will cause the wandering motion in position and altitude

you describe even though you are stationary! An additional 5mph, if it is consistent over more than just a few seconds, seems a bit excessive, though. I'd check your speedometer!

The Garmin has some time smoothing capabilities that should reduce this wandering effect.

The classic solution to SA is to use differential correction. This is where a reference station at a known location broadcasts correction information to differential-GPS users, who then apply this information to improve accuracy. We have found it quite successful in eliminating the annoying SA error, and bring us into roughly plus-or-minus 10 meter accuracy. The coast guard broadcasts such correction signals in a standard format through a network of long wave transmitters (including one in St. Louis) for free. Various commercial interests are also broadcasting using FM sub-carriers. We use DCI (which also is available in St. Louis), but they charge a per-year subscription that can get a bit steep.

Cheers.
Jim, WU0I

Which program did you say you were using to unzip these files with?

USGS used GNUzip to compress the files, and you must use gzip to uncompress them. They are not PKzip compatible!

Rendered body type: text/plain

I thought I would post this TNC here first to allow the sig members first chance.

I have a Paccomm TNC-200 for sale. The unit has been upgraded with the new software from Paccom a couple of months ago to get the GPS features. I built the TNC from a kit, many years ago, and have never had any problems with it. So if you need another TNC....

Besides, with a DSP-2232, KPC-9612 & and the PicoTNC, something has to go!!!

So, \$75 is the price. Power, audio connectors, and manuals are included. No wall wart, I power it from my station 12VDC supply.

Terms:

I'll want a bank check or Money Order. No personal checks or COD.
When I get the check I'll ship, and pay, it UPS ground the next day. USA only.

Randy
WA2AGE

My opinions are my own.

Ryan's Application of Parkinson's Law:
Possessions increase to fill the space available for their storage.

Agreed. That's why we have a Phoenix PUG (Packet Users Group). We meet once a month on Saturday for breakfast. Phoenix PUG has no fees or dues, no board of directors, no charter, and no rules...except buy your own breakfast (unless you want to buy Barney, KB7KOE, breakfast).

It's just a bunch of people meeting to discuss packet and to help each other with problems associated with packeteering.

613. Errors in location

From: "Baker, Donn B" <dbb4@P07.RV.unisys.com>
Date: Wed, 29 Nov 95 14:48:00 CST
To: aprs-submit <aprssig@tapr.org>
Message-ID: <30BCC78F@rsvl_gw.rsvl.unisys.com>
Rendered body type: text/plain

The basic control of accuracy of location in any navigation system is the resolution of the "lines of position" (l-o-p) of the system and GPS is no exception. When we take a "fix" from a satellite, we get a circle (the "line of position"), and we are at *some* point on that circle. We look at another satellite, get a second circle, superimpose it on the first, and where the two cross, that's where we are. There are two places where the circles cross (usually), so a third fix is required to remove the ambiguity. The resolution comes into play in the angle at which the l-o-p's cross one another. If the l-o-p's cross at high angles, then the error is small and the fix is "good;" while if the lines cross at shallow angles, there is a lot of spatial uncertainty, and the fix is not so good.

Example:

```

              l-o-p #1
              /
             /
-----+----- l-o-p #2
       /
      /
a "good" fix (only two l-o-p's shown)

----- l-o-p #1
////////// l-o-p #2
-----
a "poor" fix, because the crossing is very badly defined.
```

For the best accuracy, the three satellites (or stars, if you're doing celestial navigation), should be widely separated in the sky (120 degrees apart), and near the horizon. If all three satellites are near the zenith, you will have reduced accuracy because all of the crossing angles will be very shallow; the second example above.

To get altitude information, a fourth satellite is needed, but the process is exactly the same. Note that altitude fixes can NEVER have the same accuracy as the 2D position can. I've seen (somewhere) that the best you can do is about 1/3rd the accuracy of the 2D position. Ideally, for altitude, you need 5 sats: the three at the horizon, spaced 120 degrees, one at the zenith (directly overhead), and *one at the nadir* (directly beneath). That last one is VERY difficult to receive!

Once the Selective Availability gets turned on, GPS works out to be about a couple of hundred feet for overall accuracy. I use GPS for locating grid square corners for VHF Rover operations, and antenna bearings for aiming antennas. I "trust" it to no better than 3" of arc, either latitude or longitude. If I'm contesting, to besure I've crossed the grid square boundary, I go at least the full arc minute.

Hope this helps. 73,
Donn WA2VOI EN35ja

Bob,

Let me know if you need any help with beta testing, docs, etc.

I've also heard rumblings with-in the company about a \$25 GPS sensor.
They're still in preproduction, so don't mention our company's name
on the SIG. Wouldn't it be great if we could build a \$50 TNC/GPS combo.

That's all well and good, but try asking them a TECHNICAL question, not a
parts order question. Like, "what does this feature do, I'd like to know
before I plunk my \$\$ down..." or "does the KPC-3 allow GPS timesetting in
GMT or local time?"

Ask ?'s like these and you'll get an "idunno."

Also, have you looked at another manufacturer's manual, like AEA? The

Kantronics manual leaves a lot to be desired, especially for the novice, and hey, the KPC-3 is supposed to be an entry level TNC. Not to mention their TNC wiring diagram for Yaesu HT's won't work with the FT11R, 41R, 51R.

I do a lot of technical writing (I work for a Environmental Consulting Firm) and I could do better.

616. RMC data to history files

From: Daniel Velez <dvelez@norfolk.infi.net>
Date: Wed, 29 Nov 1995 16:11:42 -0500
To: aprssig@tapr.org
Message-ID: <199511292111.QAA08609@moe.infi.net>
Rendered body type: text/plain

Someone asked if anyone had tweaked WB4APR's GPSTOHST.BAS program to look for RMC sentences. I have and use the following regularly:

```
CLS : CLEAR
REM RMCTOHST.BAS N4WZR adapted from WB4APR's GPSTOHST.BAS program
PRINT "This program takes RAW data download file from a GPS receiver in "
PRINT "NMEA-0183 RMC format, reformats it and outputs an APRS history"
PRINT "(.HST) file."
PRINT
PRINT
INPUT "Enter file name of raw GPS data"; FI$
INPUT "Enter name of OUTPUT TRACK HISTORY file"; FO$
INPUT "Enter callsign to be used with the raw data"; CALL$
INPUT "Enter symbol for character (Car >, Air ', Boat ~)"; Sym$
  IF LEN(Sym$) <> 1 THEN Sym$ = ">"
OPEN FI$ FOR INPUT AS #1
OPEN FO$ FOR OUTPUT AS #2
DO WHILE NOT EOF(1)
  LINE INPUT #1, A$
  REM $GPRMC has 12 comma-separated fields. This portion evaluates the input
  REM string character by character and generates F$(1) thru F$(12).
  REM F is field number and C is character number in A$ we're looking at.
  DIM F$(12)
  FOR A = 1 TO 12: F$(A) = "": NEXT A: F = 1: C = 1
  DO UNTIL F = 12
    IF MID$(A$, C, 1) = "," THEN F = F + 1 ELSE F$(F) = F$(F) + MID$(A$, C, 1)
    C = C + 1
  LOOP
  REM
  REM Now that we have 12 fields, we'll scrutinize them individually and
  REM build our final variables.
  REM
  LET CALL$ = LEFT$(CALL$ + " ", 10)
  UTC$ = MID$(F$(10), 1, 2) + MID$(F$(2), 1, 4)
  LAT$ = MID$(F$(4), 1, 7) + F$(5)
  LON$ = MID$(F$(6), 1, 8) + F$(7)
  CSE$ = F$(9)
  SPD$ = F$(8)
  Pkt$ = CALL$ + UTC$ + " @" + UTC$ + "z" + LAT$ + "/" + LON$ + Sym$ + CSE$ +
  "/" + SPD$ + "/raw*/RMC Fix"
  PRINT #2, Pkt$
LOOP
CLOSE
END

Precision Mapping offers a two CD set of maps of the US. I have used them for some time and they have a manual lat/lon locate feature. They are working on a GPS interface but it keeps being put off for other priorities. I spoke to them today and they are taking names of interested people. They told me a large list would move up the priority. If you have an interest in this you may wish to call them at 708 257 7616 or e-mail at jsix@ix.net.com (looks strange but thats what they gave me)

As far as FAA approval on GPS units this is true, it is true for any electronics used on aircraft if it is used for primary operations and if it is used for IFR flying. A GPS unit is not required by any means to operate an aircraft as you well know but private pilots are buying them up as a supplement to their regular nav tools as in charts, and sight.

Garmin does make some units, I believe a GPS-100 and others, which is a dash mounted GPS head that it's intended use is for aircraft. A unit of this type is intended for aircraft installations so it would only make sense to have it FAA certified.

If you are not using a GPS as a primary nav tool (have GPS units been approved yet for navigation?) and have the other required tools to navigate no one needs approval for anything.

Again I WAS TOLD BY GARMIN that is why the limit the speed, marketing! I am not making any assumptions THEY TOLD ME!!

Sorry...

NOTICE TO ALL AMATEUR RADIO APRS USERS:

The Pinellas County Sheriff's Office, Clearwater, Florida, will be sponsoring the Third Annual "Ride with the Stars" on December 2, 1995 at 0800 EST (0300 GMT).

This event, which includes a 25 Mile bike run, 7 mile bike fun ride, 7 mile inline skating event, and 5 k run will take place at historic Ft. Desoto Park located on Mullet Key near the mouth of the Tampa Bay. This event supports the annual Christmas Sharing Project for needy families.

The event will include a KPC-3/Garmin 45 GPS mobile leading the pack and APRSDR to report other tracks. The entire operation will take place on 145.790 VHF and gated via the KD4UYR gateway onto 30 M.

Wide area digipeaters in use will be KR4US-10 in downtown Clearwater, KD8AQ-11 in downtown Tampa, and KD4EFM-10 in Bartow (near Lakeland).

73 and enjoy!

Ok since this looks like there's no end to it let me tell you about my disappointing call to tech support and eventually to an engineer about my problem of not being able to interface my GPS to the KPC-3. The thing they wanted to know when i mentioned APRS, WHAT IS APRS and these folks make their living from the ham community, i mean i went right up the ladder and did not get any help with my problem at all. The engineer told me that if the GPS has the correct voltage level and is RS232 compatible it has to work. BUT IT DOESN'T, At Maggelan i got about the same story IT HAS TO WORK. But guess what it doesn't. I have no confidence in tech support after the purchase from any of the two company's. So no flames guys Hi Hi i'm still burning up from the last go around.

Rendered body type: text/plain

I meant to write this a while back ago when the thread about the MFJ radio was active.

Here are my thoughts:

Why not purchase a RS HT-202.
When they are on sale for \$99.00 its a great deal !
You get a frequency agile rig for a low price, that is running a low duty cycle application. Plug in the top connector to 12VDC and your ready to roll.
Additionally , you can keep a battery pack handy and use the radio for other applications !
The only disadvantage I see is not being able to use it on 9600.
A minor problem really , dont you think ?

ON TO GPS STUFF

More is always not better in GPS sat telemetry. IT is sometimes better to recieve 5 good sats then 5 good and 3 bad ones! I
SOMETIMES (according to my GPS screen) get 45 feet accuracy..(SOMETIMES)
ALMOST ALWAYS the accuracy is less than 100 feet.

I would like to inquire: is this common for the rest of you folk ?

Yes for the most part my Magellan NAV5000DX starts beeping as soon as i hit the edge of my driveway, it's about 25-30 feet from my tower wich is entered as my homing point (Or waypoint). I have found as the manual states that for 80 percent of the time the accuracy is less then 80 feet.

I missed the original request for ZIP codes as unfortunately I can't
read everything that comes through on this sig due to lack of time.

Are you collecting ZIP codes ONLY for U.S. APRSSIG members or for anyone
on the SIG? My ZIP-code here in Germany, 75382, is bound to conflict
with a U.S. ZIP code unless you've also got a "Country" field.

I'd like to see how much and where APRS is used elsewhere in the world!

Auf wiedersehen,

629. Re: 20 meter GATES

From: "Jerry" <jerdptro@xnet.com>
Date: Thu, 30 Nov 1995 05:37:02 +0000
To: aprssig@tapr.org
Message-ID: <199511301131.FAA03909@flood.xnet.com>
Rendered body type: text/plain

Good morning:

Currently I am one of two gates in the chicagoland area. I am
wondering if anyone on the SIG is interested in or is running a 20 or
40 meter gate. I would be very interested in putting my gate on
either of those 2 bands for purposes of testing the reliability of
those links. Anyone interested in putting gates on those bands
please let me know. We would use the suggested freqs for APRS.

Thanks
Jerry Di Pietro

I have just posted ALMAPS07.ZIP on Tapr with a new README.ALA for those of you that like maps Hi. The file is getting pretty large, in fact it's now larger than the full version of APRS74b.zip. This mapmaking is getting to be addictive i think i'm always looking for new Towns and City's to do. Everytime i see a new user pop up on the map i make a 100K map for his area.

That brings me to another topic. How APRS has grown in this area. It was not all that long ago that some older ham's (Excluding me) in this area where saying APRS will never get off the ground, Bob you remember that time). Last night i counted users on my map and counted 54, and now for the first time i see some users around Amory, MS showing up, they already installed a Digi, so that means another state to start making maps for Hi, i really have already started doing that. It's strange but i have looked up till now and have not seen any users or maps for that state at all, if i'm wrong about that i would sure like to hear about it. Happy APRS'ing

I'm a dealer and both Companies provide similar support. Kantronics outsell AEA by about 10:1 at this time. Kantronics have a better record of getting back to customers than AEA, but both will handle the easy problems right away. The AEA GPS software is not quite as versatile as the Kantronics software. Both do the job, but the Kantronics allow you to have up to 4 uproto paths which is handy as you can set up a wide, wide and a relay, wide.

just my 2 cents worth

Hi Jerry,
I got on 20m this past weekend with kb6lfm (i think that was the call); he was in san francisco, i'm in southern nh; we were on 14.0963 USB; The link was pretty good while the band held up and I encountered little qrm; he posted on ax25bbs looking for interested folks. a few others were on freq as well. In the past I've listened on 40m but not heard much (I think I heard n2czf once but was marginal; I run a sloper on 40m)

If you are interested in giving it a shot I'd be game;

One interesting thing about doing this, is what alias does one use? GATE? If GATE then we run the risk of hitting the 30m GATES as well (this is what I observed with the kb6lfm tests, packets came in via 30m, 20m, and GATE at times..) As a test probably not a big deal but probably a bad idea in general.

>Mike KD4EMI@AOL.COM
>(SOUTH FLORIDA WHERE EVERYONE'S A WIDE)

My understanding of the HT-202, is that it is a true FM radio; that being the case there's no reason why it couldn't support 9600. Just some connections to the IF and a few other's and away you go. If the radio was AFM there'd be no way.
Am I reading the schematics right or am I just deluded like normal???

Maybe you **should**. I have a KPC-3, and the manual isn't extremely bad (I've seen enough that are) but certainly isn't very good either. There could be a market for a well-written manual for the KPC-3, marketed as a pamphlet or small self-published book. If you have some experience with desktop publishing the costs for this aren't really too bad. If the wiring diagrams are poor (which they are in some cases) the prospect looks better. If you add some experience-related info on GPS interfacing, maybe you could interest the big ham radio retailers to carry your book, etc. If this works, use the revenue from these sales for advertising and mail-order, maybe? I don't know if this would really work out well, but it's something to consider.

Just a reminder. If you have not already done so, please send me your zip code and call for the ZIP Code database Bob is assembling. I'm collecting the data for him.

I have received 127 entries from the US, 6 from Canada, and 1 from Germany so far, but there must be a lot more I have not heard from yet. Let's get this database complete for Bob!

1. Send data to me personally, NOT to the entire SIG.

"chead@exame2.dseg.ti.com"

2. Put data in the subject line of your message - that's the only part of the message I will process with my ZIP code processing program!
Please use the exact format:

"ZIP zzzzz cccccc"

Where: "ZIP" is a placeholder preamble word,
"zzzzz" is your 5 digit ZIP code,
"ccccc" is your amateur call, 4 to 6 characters.

. I meant to write this a while back ago when the thread about the MFJ
. radio was active.
.
. Here are my thoughts:
.
. Why not purchase a RS HT-202.
. When they are on sale for \$99.00 its a great deal !
. You get a frequency agile rig for a low price, that is running a low duty
. cycle application. Plug in the top connector to 12VDC and your ready to

. roll.

Only if you use a *different* antenna - not the rubber duck that comes with the radio. You *might* be able to get away with low-duty-cycle activity with 5W+, but the antenna is so poor that, at least for voice, the finals frequently give out quickly after running at 5W+. This may only happen with some units, but I know several people to which this has happened. Otherwise a good radio.

Regarding the cooperation needed for efficient WIDE planning using the proposed 4-Alias Plan --

you'll find it in New Jersey and Southeastern Pennsylvania. The area is small enough so that we "Network Builders" can get together and work out the kinks before they become real cramps!

I wish this could've been accomplished when the "other" packet entities (01, 03, 05, 07 etc.) were in their infancy. Planning and cooperation to implement that planning is a necessity. It can always be **UNDONE** if it didn't work but you'll never know for sure if you didn't try.

South Florida, I wish you good luck... personalities are tough to mix!

Just got a new flyer from Radio Shack, their number 534 (on last page).

On page 7 of the flyer is the following announcement:

"RadioShack Unlimited brings you the Latest!

Get the latest in revolutionary technology delivered right to your front door - like the amazing new Global Positioning Systems that can pinpoint your position to within a few feet anywhere on earth! Starting as low as \$229.99."

There are tiny pictures of two different receivers, but too small to make out many details. No other information and no catalog numbers given.

Interesting - looks like the prices are coming down again! FYI.

Reply to: aprssig@tapr.org
To: aprssig@zentropa
Subject: [APRSSIG:3716] Data radio 9600 baud

I have two HTX-202 units I use for remote tracking and APRS use.
These unit put out 8+ Watts when powered by 13.5 - 14.00 Volts.
(The HXT-404 70 cm HT does only 5 Watts.)

For only \$40 more you get a radio you can tune and get a few more watts.
(Gee, it is even a back up HT)

Think about getting the Radio-Shack extended warrenty if you are going
to run it a 8 watts as a digipeater.

I also found a 9600 baud mod for the HTX-202.

----- CONNECTIONS TO REALISTIC HTX-202 FOR 9600 BAUD PACKET

NOTE: The following operation requires soldering in very close quarters and damage or destruction of your radio is possible if you get too much heat on nearby wires or components, or by sloppy soldering.

I performed these operations on my own HTX-202 and it works OK for 9600 baud operation with my new Kantronics KPC-9612. I don't take any responsibility for invalidation of warranty or improper operation of the radio, etc.

I studied the schematics and determined the locations for making connections based on general recommendations for 9600 FSK. I didn't want to permanently deface my radio by making any holes in the case for wire penetrations, so I removed the battery and battery connector which is a plastic oval with a spring contact in it held by two screws and ran the wires out to the connector that goes to the TNC. I can restore it to original condition in just a few minutes. I used the smallest coax I had avail, I think it is RG-174. Someone may have a better idea about doing that part.

Open up the HTX-202 by removing the five screws, take off back cover, and separate front panel and lay it on bench so that flex pc cable won't be damaged.

This is a crude diagram of the inside of HTX-202 after splitting case and folding front case aside. There are several sub-PCBs standing on edge that I represented by the dashed lines. In my HTX-202 the sub-board at upper left is labeled HF and the raw output from the discriminator IC goes into pin 1, the first solder pad starting from the center of the radio. This is where I soldered a small coax and ran it out the hole in bottom of case. This is Receive Audio into TNC.

The sub-board labeled MIC is microphone audio to modulator varicap. Pin 6 here goes directly into the VCO and this is where I soldered a second coax. The solder pad 6th pin from center of radio is right next to the RV1 deviation pot. (Dont melt the pot.) This is Transmit Audio from TNC.

The third connection, PTT, is harder to describe the actual point. What I did was flip the radio over and used a ohm meter to locate the solder trace from the center pin contact of external mike socket. It runs from just below mike socket to a small SMD resistor. I soldered a 2k resistor here and ran a tiny wire from other end of it, along the side of radio and out a slot in case where the cover wouldn't pinch it, and through the hole in the bottom.

The radio now has to be operated by a power supply, since the battery contact is gone and the wires are coming out the hole in the bottom. I lengthened the power wire that was removed from the contact and connected it to the same power supply as my TNC. The coax and PTT wires go to the DB15 connector for the KPC-9612. I used the coax shield for RX Audio as the ground connection, but left the TX Audio shield un-grounded at the DB15.

I am still in the process of evaluating how well this works on 9600 baud packet. There are very few VHF 9600 baud stations near me (only one, in fact) but hopefully in the future this will change. Good luck, and I welcome any feedback about this.....

Gene, WA4WBI

It would also be nice to come up with a designated 10m frequency before the band opens again. Packet on 10 meters is kind of fun - you can run 1200 baud FSK using a standard TNC and decent SSB radio. We should see some pretty reliable coast to coast paths open up on a daily basis when conditions improve. 1200 baud mobile HF operation should be quite feasible as well.

Jack

>Gene, WA4WBI

Your other question

>SOMETIMES (according to my GPS screen) get 45 feet accuracy..(SOMETIMES)

The real accuracy is only as good as the input data and SA controls that.

I can't always find my car in the parking lot but my Garmin-45 can
find the parking lot :-)

The GPS' in the picture sure looked like Magellans to me, if I recall correctly, but it has been over a week since I looked at the ad. Now all they need to do is market a TNC...

It seems that RS is going to market a lot of NON-RS products now, from TV's to computers, to night vision. They don't even seem to be taking the pretense of putting their name on them either. I guess since Tandy runs Incredible Universe & Computer City, too, this makes sense.

It might help if APRS users that are outside the USA sent their Grid sq. to Claude. I don't want to make his work any harder but I also would like to know where the sig users are. A 6 digit grid sq might even be closer than a zip-code.

Here is the track history file of everyone on the sig for which we have ZIP codes. The following user's zips did not match the database and are not shown. If these users send their LAT/LONG of the center of their ZIP codes to me WB4APR, I will update my ZIP database...

ZIPS NOT matched:
24551 W4WWQ
93555 K6UUR
94404 W7KKE
94712 N6FRI
96706 WH6YC
97391 N7LVK
97394 W6TCA and W7BFX

For people that have not yet responded with their ZIP and call, send them to Claude as noted in the other messages...

CUT HERE AND SAVE AS ZIP-SIG.HST in your HSTS directory -----

At 09:57 AM 11/30/95 -0600, Willson Flor wrote:

>Maybe you *should*. I have a KPC-3, and the manual isn't extremely bad (I've seen enough that are) but certainly isn't very good either. There could be a market for a well-written manual for the KPC-3, marketed as a pamphlet or small self-published book. If you have some experience with desktop publishing the costs for this aren't really too bad. If the wiring diagrams are poor (which they are in some cases) the prospect looks better. If you add some experience-related info on GPS interfacing, maybe you could interest the big ham radio retailers to carry your book, etc. If this works, use the revenue from these sales for advertising and mail-order, maybe? I don't know if this would really work out well, but it's something to consider.

>-Will Flor
 >KB9JTT
 >willf@rrgroup.com
 >

I've considered it. In fact, I've given a 2 hour presentation on Packet and APRS, just recently for the ThunderBird (formerly Honeywell) ARC, here in Phoenix, and may do similar presentations for other local clubs.

Time constraints and a thorough knowledge of the publishing business (I worked for a book wholesaler for 7 years, a newspaper for 6 years, and commercial print shop for 2 years) keeps me from even wanting to go the book route. But my presentation(s) do include a lengthy self-written handout which I put together on my word-processor. A FAQ may be in order, though.

My complaints about Kantronics manuals are *relative* based on a comparison of AEA's PK-12 manual. One really can't understand until you compare the two, side-by-side.

I realize the electronics/software fields are plagued by problems and I (as well as others) have detected faults in many products and their manuals, unfortunately many companies do little to correct these faults or make the consumer aware. The Yeasu FT-51R has at least one glitch in it's firmware with 15 HZ step tuning (corrected now and free upgrades), but to my knowledge Yaesu hasn't updated any of the errors or included an errata sheet in its manuals. For instance, they make no mention that the radio has to be in duplex mode for the cross-band repeat function to work, and I know they've received HUNDREDS of inquiries about this.

I recently bought a Diamond Stealth Video card that refused to work in Windows, and I plus two computer techs couldn't make the thing work. We downloaded the new drivers from Diamond's FTP site and the thing still wouldn't work. Diamond Tech support never returned my calls. Finally after being on long distance hold for 35 minutes, I got to talk to a human there. He knew exactly what the problem was, because they'd gotten so many calls on it. Yet they HAD NOT posted this fix on their errata sheet, nor had they bothered to add the 3 or so lines of code to their install program to fix it, despite knowing of the problem for months!

I've noted and had problems industry wide, including a call to GE tech support where I got a female who read the sales brochures over the phone and could not answer technical questions, nor put me in touch with anyone who could. And I'm embarrassed to repeat some of the "technical" explanations

I've heard from Radio Shack employees, especially about Amateur Radio and antennas...including one RS regional manager who was trying to sell some poor guy a 100 inch whip antenna to ROOF MOUNT on his sedan when he came in looking for a 1/2 wave end-fed antenna for his CB. I had to walk out in disgust. This manager had no clue as to polarization or the realities of a whip that large in regards to wind-sway or parking garages.

"You got questions, we've got answers," Yup, the wrong ones.

If companies would just put some people in tech support with some technical knowledge...

By now you all have the ZIP-SIG.hst and WE can see what the SIG represents. Now that I can see who I am talking to, here are some initial comments:

- 1) Known APRS activity not apparently represented on the SIG:
Central Iowa, Arizona
- 2) For WA0LPV and N0NG in North dakota, I just did a map of NE ND. Im not sure if it is in distro yet, but it will be soon!
- 3) For WM3L in PA, there are plans affoot for a BIG digi in Newmanstown at 850 feet HAAT! This will help PA immensely
- 4) Note to ALL SIG users. If you see an area near you on your local APRS maps that does not appear to be represented here on the sig, you can be the interface, and pass along anything of value that you see here on the SIG to those other locals...

Have FUN!

Just a routine update to further streamline operations:

Ver 74c: minor tweaks

- * When stn is hooked, you see more DIGIPATH and less HEARD log
 - * Fixed CRASH on NETROM packets beginning with > found in Europe
 - * Smaller symbols eases congestion in dense areas.
 - * More helpful info on the SEND screen
 - * SEND message TO field default brings down the DIGIPATH too
 - * Band switching for PK-900 and DSP-2232 (maybe. I hope it works)
 - * REPLAY filename is kept as default for repetitive use. This is useful when viewing the ZIP-SIG.HST file. You can zoom in various areas and just hit FILE-REPLAY-ENTER to see the file again...
 - * Modified GPStoHST.bas so that it can also use RMC sentences
 - * TRACKed posit will NOT scroll off bottom of P-list if left unattended. N4UL5 told his wife to watch him all week on travel, but found that after 4 hours, his posit had been bumped off the bottom of the P-list!
 - * Telemetry page accepts new MIM module with 5 analog and 8 digital channels
- Plus it has a NMEA input for position reporting.
-

The network in the NW Texas, NE NM, and SW KS area is still improving. I was able to get a posit back into Amarillo TX from just south of Pueblo CO, over the TNXGIVING holiday with 5 watts while mobile. We now have 9 RELAY/WIDE nodes in the area ranging from Abilene TX to the CO border (still a few dead areas, but pretty good coverage). At the present time all nodes are on 145.01, with a few on 145.09. We are planning on putting up a 01 to 79 gate soon to take the APRS traffic off of 01 in the Amarillo Metro area (a big population of 170,000). Hope to have most areas covered by spring as I will be using APRS for storm tracking and keeping track of spotters as an ARES EC and the Panhandle SKYWARN Severe Weather Net Manager/NCS. If any one would like to see what digis we have, let me know and I'll send you the file (Bob APR, fear not I'll keep you posted). If you are traveling I-40 or US 87 thru the NW TX area, be sure to change over to 145.01 so we can see you.

> down south to TFZ, WITHOUT A SINGLE DUPE!

Ok, is it SAFE to ASSUME that each digi ONLY HEARS its immediate neighbor in this string?? Of course if that is the case then the string mentioned above doesn't work. So it appears the APR11 can be heard by IPH15, APR1, and HDL. The same must hold true for the other direction (for HOB15). Ok now Bob for this method to work with a growing system, set up some more rows so that each node is heard by 4 other nodes. Meaning create your coverage scheme so that you can work the same distance in ALL directions with out dupes. I believe that was you ORIGINAL CHALLENGE. With your current plan you are still only addressing the LINEAR coverage. I must admit though Its not a bad plan. It does kinda look like my original suggestion of State, Regional, and Local ALIAS scheme though. Considering that most states are already divided into 4 regions by the PBBS H-routing scheme.

This may add some real interesting aspects to it....grin.
Not to mention the fun band openings when, the Nets and Links don't fall into the proper sequence.

This brings up another question. How far down into VA towards the KY,TN,NC borders does the network up there come? I may have another twist to this.

658. COM-BUFFER-OVERRUN errors

From: moyers@ibm.net
Date: Thu, 30 Nov 95 22:40:03 +0000
To: aprssig@tapr.org
Message-ID: <9512010649.AA0030@slip166-72-241-98.tn.us.ibm.net>
Rendered body type: text/plain

I seem to be getting Comm-Buffer-Overflow errors anytime I am typing comments to another station while running in WX station mode. This also seems to be happening while in a command window after exiting from the command. The only way I have found to correct the error so far is to unplug the WX station cable and then plug it back in, thus clearing the overrun. Both of my comports run 16550 (buffered) uarts and I don't have this problem with FBB running 3 comm ports at 9600 baud. For awhile I thought it may have been the a conflict with the OS. However I have now tested it under DOS 6.22, OS\2 v3.0, and WFWG 3.11, all having the same results under the same conditions. I am now wondering if APRS is trying to access BOTH comms 1 and 2 at the same time and thereby creating the lockup. ANYBODY HAVE ANY IDEAS?? Having to cycle the plug on the WX station after every return when keyboarding is getting OLD REAL QUICK.

I'd sure hate to make an IFR approach with a navigation instrument having 300 ft or more error. Runways are just not that wide.

GPS will never be IFR certified as long as they have the built in error.

"We" is the Mapping Sciences laboratory at Texas A&M. I'll have to see what we have available, and in what formats. So far, I've had little enough luck converting ARC-Info-generated DLGs to make APRS maps successfully... We're gonna try .GRAs tomorrow!

just as a point of reference, and completely off the top of my head, RG-58 is worth about 1 dB of loss per foot, and RG-174 about 2.4 dB.

I use 18 inches of RG-174 on the cow boxes, with a passive antenna. Works real good there!

If you are in the central Florida area, there is APRS activity growing every day. We in Polk County just got a WIDE area digi on the air that linked the Tampa Bay area with Orlando. The same digi will connect the south east coast as well on most nights. Also, we have a new GATE station here in Polk.

My Garmin GPS-55AVD and I go everywhere together. I'd not think of trying to make a trip without it. Oh, and when I've correlated it to my instrument approaches, it's always gotten me to the end of the runway... just where it should be.

> GPS will never be IFR certified as long as they have the built in error.

'Scuse me? Care to meet TSO-C-129? that's the spec for approving GPS receivers as primary navigation devices for enroute and approach operations. And there are several out there who already meet the criteria. In my opinion, the spec is at least a little too strict!

The FAA has let contracts for their "Wide Area Augmentation System" which, to us mortals, is DGPS in one form or another. If I understand the latest system, it'll use pseudolites, and that means a whole bunch of the GPS receivers available today will see the "birds" and just operate. With no dither, and little error.

Precision Mapping is also provided for windows on a single CDROM. I have found the manual lat/lon feature more beneficial for making local maps than the stuff I've managed to dl from USGS or any of the maps I've seen constructed from empirical GPS data.

The Precision Mapping data is derived from, and has the same accuracy, as the USGS data. In addition, for S. FL., it is more up-to-date than the dl'd info from edcftgp.cr.usgs.gov. Also, the data points from the dl'd service seem to be somewhat confusing. For example I've found road tracks which overlay one another, but with different feature addresses. Also they all come out a drab grey. Finally I suggest that 1 mile maps are an overkill. Generally motorists travel on highways rather than local roads. My observations suggest that, for S. FL., 32 to 64 mile maps are more usefull. (I do use a 8 mile map for my locality... derived from PM.)

I've found that the data derived from GPS tracking sometimes fails to match the Precision Mapping data. On one occasion, a GPS receiver parked in my driveway indicated my house to be 0.1 mile away! I suggest that gross accuracy doesn't justify a 1 mile scaled map.

Finally creating the maps from scratch, assisted by PM, is more entertaining than patching the faults found by either of the other two methods.

That's not APRS' fault, as standard QBASIC doesn't even run under dosemu (exact same failure)! I think the Linux folks are working on it. They at least know about it.

Meanwhile, a Linux/XFree86 version of APRS is rumored to be being considered by the MAC-APRS/Windows brothers. Now *that* would be great!

Is there any demographical info. on APRS users with regards to what O/S they typically use?

Hello... this is for the fellow who wrote about experiencing Comm Buffer Overflows... sorry, I forgot his name/address:

I run APRS 7.4C with a TNC (tried KPC-3 and MFJ-1270B and C) on COM1: with an Ultimeter-II on COM2: of a kludged-together '286 and have never experienced a COMM-BUFFER-OVERFLOW while active at the keyboard with program manipulation or messaging with another station.

I have seen that "error" SOMETIMES but only while booting up but it quickly disappears within seconds when everything settles in. I think my old junk-box '286 runs at 6 or 8-MHz MAYBE... certainly no faster than 10-MHz.

The U-II talks to the computer at 2400-b/s while the TNC communicates at 9600-b/s. I have APRS go get a WX string every 15-seconds which you can see

in the blue box at the top-middle of the display. It beacons that weather every 5-min and all the while frames are being monitored and displayed at the bottom.

This has worked this way way back several versions. Good luck... I hope I have explained my configuration well enough for you to "stare-and-compare" how yours is configured compared to mine... helps sometime!

Well to each his own i guess but i find that the 1 mile maps (Actually 2 mile) are just great for such things as local events, Fox hunting etc. In fact on the last local fochunt i directed the later winner directly to within one block of the fox, this was only due to the fact that i could zoom in to a street level map of the area. So those that feel the highly detailed maps are not usefull to them don't need to use them. Like i have said before turn the 1 mile switch off HI.

I _think_ that there is a 20m gate set up in Grand Rapids, MI, but am
not sure, as I'm new to APRS, and it's in its infancy over here
anyway.. Upon monitoring 2M, I received beacons from eastern
Michigan, and one in Northern Ohio. I believe these were digi'd from
20m.

I am interested in getting some connections up from western michigan
to chicago. Currently, I'm 2 meters only, however. It seems to me,
that two big beams across 75 miles of water should work pretty well,
but what do I know? :)

Once I figure out our current setup over here, I'll post a message,
or HST file or something.

Sorry to tell you, but my King KLN90B GPS *IS* certified for IFR enroute and
GPS approaches. With the moving map built in it sure is slick (but for
\$12,000 it should be!).

I just had the radio shop drop some wires for RS-232 output, but it is not
in standard \$GPXXX format. I have a copy of the format and am looking for
someone to write a program that could be burned into a chip for the KPC-3 so
I can run airmobile. Any takers??? Wonder how it would work at
16,000-25,000 where I usually fly?

Well no wonder...

Some guy in Cinci was pathing WIDE,WIDE,WIDE,WIDE. Talk about redundant
echos! :)

It was interesting, tho- glad it didn't last too long. I liked it better when I saw WB4APR in Atlanta via WIDE,WIDE last month. That was some decent packet dx.

NO there is NO gate on 20M in Grand Rapids.. That is all from 145.790Mhz when the Band is open.. WE could use a gate here in Grand Rapids on 30M even since our Gate provider's radio is in the Hospital.

Besides, Northern Ohio and Eastern Mi. is too close for 20...

I am very new to the aprssig and don't know about available documentation for the KPC-3, but I assume they don't give out enough information to re-program their device. Re-engineering the ROM is very time consuming.

Your best bet would probably be to build a translator device that translates your GPS's output to the NMEA codes. There are some relatively cheap single board computers (\$150) that could be programmed to do the needed translation. If you are a little more industrious, you could put together a simple board with a microcontroller (87C51--has built in EPROM and serial output) and a serial transceiver chip.

If you send me the format of your GPS's output, I'd be willing to look at it and give you more feedback. If you e-mail me, don't expect a reply until after Monday--I'll be out of town.

Did anybody else hear an FM signal on 10.150 yesterday with spanish voice broadcast? I first heard it around 5:30 pm CST and it was gone at 7:30pm. I switched in attenuators in the receiver to verify whether it was IM or not. It seemed to be a real signal, and did a pretty good job of clobbering 30m APRS while it was there.

You are excused, but a spec doesn't make it happen. No equipment with 300'
error will ever be acceptable for IFR approach.

Aw so! I'd believe that the military GPS version would handle the
precision problem, just as I know that the present hobby, maritime, cross
country navigation configurations will not. Sounds like the future
equipment is a step beyond what we are now using.

btw, I've never heard of a pseudolite. What is it?

Some of us are working with other things besides tracking cars. I've got some
software on the burner now that provides Flight-Director-type graphics when it
sees WAS or usable differential. As for an approach that I back up with the
GPS, if I have the overlay already plugged into the GPS as waypoints, and use
that as a belt-and-suspenders backup, I feel it's prudent.

It is *NEVER* my primary approach tool. It's not certified. It is, however,
apparently more reliable than ARC/Sperry radios!

I earned my private pilot license at Danbury Ct. I well understand VOR
approaches and turbulent conditions. But I believe that the real
question is whether you might attempt an IFR approach/landing with a
300' lateral error. At Danbury that would put you snuggled neatly amongst

the hillside pine trees.

As a backup? Yes. As a primary system? No. Having suffered SEVERAL systems
 failures in rented aircraft, the handheld GPS and handheld radio are mandatory
 for me now. Period.

> You are excused, but a spec doesn't make it happen. No equipment with 300'
 > error will ever be acceptable for IFR approach.

Unfortunately, you're not familiar with the equipment out there, or the RMS
 error enjoyed most of the time. The fact that C/A code with SA on promises no
 more than 100 meter resolutions does not mean that you actually see that.
 Recall that the erroneous effects of SA are mitigated to some (pretty large)
 extent by parallel processing and increased dynamic conditions. An airplane
 is better suited for GPS navigation than your car or bicycle.

The spec for terminal and non-precision approach navigation requires the same
 basic performance from the receiver, including a separate channel that scans
 all satellites and notifies the receiver when it encounters a different
 solution from the "main" channels. This "receiver autonomous integrity
 monitoring" function is integral to making sure you don't wander off into
 space. Recall that the military units use P-code, with a much higher chip
 rate than C/A (the civilian code), but still use C/A for initial timing.

One of the big, big debates prior to the C-129 release was whether you could
 actually do area navigation with a GPS with SA on. The FAA was skeptical.
 The Aircraft Owners and Pilots Association was pivotal in convincing them that
 it could be done... as they were with overlaid approaches.

Precision approaches will definately require differential correction, and from
 the immediate area of the terminal facility so that the same PRNs are being
 used, else you are NOT correcting!

> btw, I've never heard of a pseudolite. What is it?

A baby satellite that's on a fixed and well known spot on the ground. It doesn't move, it uses the Gold codes, it uses C/A, it's compatible with the receivers today, and it fits into the almanac and ephemeris messages. the original standard called for them to serve a 50 km radius area.

Rendered body type: text/plain

We are in the middle of the annual football run. As you can see, I have time to send this message. The reason is, APRSdr is doing all the work! We have 4 TRACKERS strethced out over 100 miles and my 3 are all 1 watt trackers. There are BIG gaps in coverage between DIGIS and home stations, but it doesnt matter much. This is because we have an object labeled FOOTBALL being Dead-Reckoned (DR) by APRSdr.

With APRSdr, the FOOTBALL just keeps on truckin' at 7 Knots (128 runners 2 miles at a time in pairs) along the established route (color purple #13). The shuttle vehicles come and go, and whenever I see the Football DR more than a few minutes off, I just hook it and move it where it should be (about once an hour or so). My laptop is runnning the APRSdr via an HT and rubber duck. It sends out a NEW posit on the FOOTBALL once every 3 minutes via my normal APRS rig (RELAY) to the next WIDE and then the GATE...

Even the mobiles do well through the gaps. The normal APRS DR function just keeps on plotting them, and sure enough, when they approach a nearby RELAY or WIDE, they POP up, and their DR disappears...

I know that many of you turn off DR, but it is a WONDERFUL TOOL! Most importatnly, the first thing it tells you is whether your PC clock is on time! If you immediately see DR lines everywhere, then FIX your PC clock, dont turn off DR! In this sense, DR is a WARNING, FIX the problem, dont turn off the alarm!

With your PC clock set properly DATE, TIME and TIMEZONE, and DAYLIGHT savings time (yes 4 items!) then you wont see DR LINES, unless you havent heard from the mobile in a while. If you have DR off, the screen looks nice, but you DO NOT know if the positions are REAL and CURRENT. Only with DR ON can you be assured that the positions you are seeing are REAL!

I think I posted something earlier today about APRSdr was NOT working on an exact NORTH line. WRONG. I had changed my PC clock (see above) and the APRSdr algorithm was doing just what it should. I had changed my clock by an hour for STANDARD time, and the DR was going off into the woods by an hour...

So APRSdr is alive an well. Even for the BUS which was not GPS equipped, when it left here with 45 mids onboard, I just gave it a speed of 50 Knots and watched it DR all the way to the mid check point. I got three visuals by other vehicles along the way that saw the bus, and updated the DR at each sighting. To all other APRS opservers, it looke like the BUS was tracking too...

Even without APRSdr, you can still do this for your event. With normal APRS you can still put an OBJ on the map and give it a course and speed. When it DRs past a corner, you have to hook the posit, estimate how far around the bend to place him, and then INSert him where he should be and estimate a new COURSE..

In conclusion: APRSdr is a GREAT tool for "predictable" events AND If you are turning off DR, you are not using APRS properly.

P.S. Dont forget about the POSITION ALARM. A group of mids was waiting for the shuttle. Last posit was 20 miles out and the DR line was off at 45 degrees to us, but its LENGTH made it clear that they were CLOSE. So, I put a POSIT alarm on the old posit, so I would know INSTANTLY when a new posit came in. Sure enough, 5 minutes later the bells went off, and I knew he was close, (or at lest that I had an update)... There they were, only minutes away (but pulling into the 7-11!).

33. ZIP-SIG.ZIP

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Fri, 1 Dec 1995 21:41:59 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951201213203.29636A-100000@greatlakes>
Rendered body type: text/plain

I just posted the latest version (and last for a while) of the ZIP-SIG.HST file on tapr. You can replay this file and see where all the SIG users live. I had sent out some earlier messages about ZIP codes missing from my database, but actually, those were instances of where more than one station had the same ZIP code. (and therefore my program could not make a second match). So only one call will show at each ZIP code. (the first one reported). I hope your egos can handle it, hi hi...

If you got the first file that I sent to everyone, there is little new, except for a few more calls, and the ARIZONA and IOWA states are now represented... Again, you will find the APRS74c to be handy, since on FILE-REPLY, it retains the path and file name of the last file REPLAYED. This makes it easy to repetatively replay the ZIP-SIG file while zooming into different areas...

34. APRS Live Round table via Internet ?

From: n2czf@gate.net
Date: Fri, 1 Dec 1995 22:27:53 -0500
To: aprssig@tapr.org
Message-ID: <199512020327.WAA42664@tequesta.gate.net>
Rendered body type: text/plain

Just a thought I had that I would pass along to other sig users.

With so many APRS users on Internet now how about letting everyone in two areas TALK with each other via a local repeater using Internet as a link!

No expensive equipment is needed and regular sig members can set up a net at a predetermined time between two active areas so ideas can be exchanged. All that is needed is Internet Phone, permission to use a repeater that can cover most of the local APRS area and a VOX BOX from Radio Shack.

Purchase a Voice Activated Telephone Remote Control box RS# 43-263 and cut or remove R7 a 3.3 meg resistor. Replace that opening with a 1 meg resistor and the modification is COMPLETE! R7 controls the hang time and sets it at about 1 second. Pump your VHF or UHF radio's audio into a Sound Blaster's input (BE CAREFUL with the amount of level!!) and connect your Blaster's audio output to the VOX input. Take the VOX output and feed it to the radio with proper level adjustments and the VOX Box switch line and connect to your PTT on the radio. You now have a Internet<->VHF or UHF Link in operation.

Once the two internet stations connect to each other everyone will be able to converse in normal fashion but be aware of VOX circuits in the link and give plenty of time to let the units activate and deactivate. This would be a great way to "teleconference" two active APRS areas so that ideas can be passed along and APRS users that need help can ask other experienced users in other areas.

Yes, we do that on the sig all the time but how many users do you have in your area that are not on internet, or how often have you wondered what so and so really sounds like in person ??

The real test will be when more than one link can be established at a time and we can get a country wide APRS meeting real-time over the internet! Anyone have experience as net control with EXTREMELY large nets ? hi hi

By the way i have done this also, i have talked on several repeaters using I-Phone and in fact talk to many many hams that way. I have a setup similar but i use the Ramsey Vox board for the delay, really works great, Had a QSO

with Ralph N4NEQ the other night about mapmaking chatted for about an hour as you know he's in Atlanta and i'm near Huntsville,AL works great. SO far i must have logged about 20 country's and hate to guess how many states and don't even have any HF equipment Hi.

36. Improved MKMAPKKE.ZIP

From: KSwaggart@aol.com
Date: Sat, 2 Dec 1995 00:35:33 -0500
To: aprssig@tapr.org
Message-ID: <951202003532_122700461@emout06.mail.aol.com>
Rendered body type: text/plain

For the APRS !:100K map makers, I've uploaded an improved version of MKMAPKKE to tapr.org:/tapr/SIG/aprssig/uploads.

This "tweak" to John Cavanagh's (KB4XF) great mkmapk1 program includes a menu which allows you to include railroads, elevation contour lines, city/town boundarys, and force the inclusion of streams at any scale.

MKMAPKKE also extracts trails and streams for maps of 2 mile scale or less. Airports are always extracted if you have the Miscellaneous Transportation Features files.

A text file, MKMAPKKE.TXT, is included which describes the new map making features. Also, a sample map and .DAT file showing a contour map along the coast north of San Francisco is also included which you can view using MAPFIXxx.

Have fun and keep cranking out those maps!

37. Sig list for MACAPRS

From: kc5ejk@onramp.net (Robert Winingham)
Date: Fri, 1 Dec 1995 23:50:09 -0600

To: aprssig@tapr.org
Message-ID: <v02130500ace5970d27ec@[199.1.11.163]>
Rendered body type: text/plain

I re-formatted and removed a few double decimal points
The re-format was just a simple find and replace but
here it is to save time.

Use the OPEN FILE menu not the OPEN Call Sign file menu command.

The little PIC chips would be able to handle that I'd thing. Those
are rather cheap. Less than \$100. Someone with the development
tools would have to develop it, though.

39. MKMAPKKE

From: ke4eer@ro.com (William Nolle)
Date: Sat, 02 Dec 1995 07:21:09
To: aprssig@tapr.org
Message-ID: <199512021428.IAA12321@sh1.ro.com>
Rendered body type: text/plain

Ken Swaggert posted a message here stating that he had posted an updated
version of MKMAPKKE on tapr but i sure can't find it, then i attempted to send
Ken a e-mail message and it was returned by my postmaster saying there is no
address like kswaggert@aol.com. Ok Ken whats up Hi...

Bill KE4EER

40. MKMAPKKE.ZIP now at tapr

From: KSwaggart@aol.com
Date: Sat, 2 Dec 1995 10:07:48 -0500
To: aprssig@tapr.org
Message-ID: <951202100747_41702780@emout06.mail.aol.com>
Rendered body type: text/plain

Don't know what happend to the first upload. Just uploaded again to:

tapr.org:/tapr/SIG/aprssig/upload at 0700 PST, Saturday, 2 DEC. This time I
checked the directory and confirmed it is there. Strange.

I'm still here at kswaggart@aol.com

Thr Alinco DR-1200, is being discontinued. It can be found for around \$200.00 or less at various suppliers. Just purchased on for \$209.00 at HRO. True FM, synthesized, and 25 watts out. Almost too much radio for a packet rig, but for \$200.00, not bad.

Ben WS5R DM95cf

In a system in use in our County, we had 6 DR-1200/KPC-2/3 combos running.. Only down time from any for a five year time spread was caused by a theft.

I am ordering one Monday.. Thanks for the TIP!

Rendered body type: text/plain

Consider 74c a BETA test, hi hi. In making he DIGI list longer and the HEARD list shorter on the HOOKED display at the bottom of the screen, I goofed and the HEARD data is now LONGER and wraps around over top of the POSIT line. This is a TRIVIAL problem, but I'm going to fix it immediately and release 74d. SO do not further distro 74c. 74D will be done in 2 hours...

Rendered body type: text/plain

Well, I now have feedback about the BAND switching for the AEA dual band TNC's also does not yet work right. SO rather than making a 74D immediately, and since the word is out to not distro 74c further, I will hold off a few days and make another crack at thte dual band switching.

So if you already have 74c, USE IT. But feedback any bugs you see, and do NOT further distro it, since it will be soon replaced...

>question still remains, Do we need to set BOTH \$GPGGA and \$GPRMC ?

You will get some extra information by having both.

1. I used a different UNP path for one to see how that helps get the information back home.
2. The GGA has height information plus location
The RMC has Speed and direction and the location

Most people, I think, just use RMC

\$GPRMC,023742,A,3411.615,N,11807.967,W,003.5,320.7,110495,,*05
\$GPGGA,023742,3411.616,N,11807.967,W,1,00,2.7,368.9,M,-31.4,M,,*7B

=== From Sebastian Birnbach Via sci.geo.satellite-nav newsgroup ===

The GPS 45 outputs the following NMEA dataframes in cycles of approx. one every two seconds:

\$GPGSV GPS satellites in view
\$PGRME unknown
\$GPGLL GPS latitude and longitude
\$PGRMZ altitude above normal zero
\$PGRMM selected map datum
\$GPBOD GPS bearing, origin to destination
\$GPWPL GPS waypoint location (different WP of track 0 each cycle)

\$GPRMC GPS recommended minimum specific GPS/TRANSIT data
\$GPRMB GPS recommended minimum navigation information
\$GPGGA GPS fix data
\$GPGSA GPS DOP and active satellites

Hand held gps is not type accepted or certified for aircraft use. It is to be used for VFR only and not as primary navigation equipment. The major difference between a Magellan Skyblazer and a Trailblazer for example is the inclusion of an internal database and other features that are aviation oriented. Garmin is the only GPS manufacturer bent on making a major distinction by limiting top end speed on a unit. Our first GPS we used in a plane was a Trimble Transpack which worked reasonably well even though it was a surveyor's instrument and had absolutely no internal database for aviation. There is no certification cost to be included in the price of the Aviation Garmin GPS's.

55. CHANGE 145.79?!

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 3 Dec 1995 00:54:58 -0500 (EST)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.951203002331.1650A-100000@greatlakes>
Rendered body type: text/plain

Well, I just finished reading the latest AMSAT journal, and it seems clear to me that the 145.80 frequency for future manned spacecraft is pretty well established WORLDWIDE.

Maybe we on APRS should move down 5 KHz to 145.785.

THIS would give us a 15 KHz split between the users down on 145.77 and the space guys on 145.80. That should work fine, since 15 KHz splits have been shown to work just fine on the 2 meter band with modern rigs.

One further advantage is that most SPACE folks should be encouraged to monitor 145.805 since they will first hear the spacecraft with +3 KHz doppler anyway. Then they can tune downward if they want to track the pass.

Many of us have invested heavily in xtals on 145.79. Probably most XTALS will tune down. Some wont. But now that MFJ is delivering their 5 watt digital radios XTALED on 145.79, we need to make this decision quickly and get on with it. (MFJ finally agreed to STOCK .79 xtals! I dont want to see them get burned...)

I know it is after midnight, and this may be a knee jerk reaction, but I am willing to MOVE. BUT lets all discuss this and see if we all agree?

In conclusion:

- * It will work. It solves the conflict. It supports MANNED HAM radio from space, it will not significantly affect .77 users. It is all-in-all the only possible solution. Some of us may need to re-crystal, but the peace-of-mind will be worth it.

- * I suggest that APRS stations put out bulletins on their local nets to find out who "cant" change their XTALS. Most nets may be able to shift over night (plus negotiating driving time to the digi sites from their wives).

- * To prevent overloading both the AMSAT and APRS nets with redundant traffic, lets assume that EVERYONE agrees. Only reply if you DISSAGREE or have another idea.

* For the sake of discussion, would targeting something like 1 January give everyone a target date, either for "doing" or for "arguing", hi hi.

Bob,

In Regards to moving from 145.790 - 145.785:

Doesn't REALLY matter here. Most rigs I have on APRS are either EPROM or Dial-up Radios.

IF 5Khz makes THAT much difference to the Manned Missions, then lets change NOW before APRS gets TOO large to be flexible.

I will broadcast a message here on my local VHF net and get the user's input.. I don't think its is going to make any difference here at all..

Better to change now than in another year...

Oh Sure! and then loose two coordinated frequencies!

I don't care how modern your rig is, your modulation is well over a 15 kHz channel, you will also receive hits from the users as well as the high level nodes on 77. If we ever go to 9600 you will want a 20 kHz channel at a mininum. Just where do you think you will find a good 9600 channel after you take 79 and 77 and create low speed frequencies out of them. The Packet Band Plan is on 20 kHz channels for a reason!!!

> One further advantage is that most SPACE folks should be encouraged to

Could it be you have a trick up your sleeve? Most sat folks are not operating at or near the sat band edges...most serious sat users have software to track and aim their antenna. Way too complex to do this manually.

> Many of us have invested heavily in xtals on 145.79. Probably most

> I dont want to see them get burned...)

Yes you can "tune down" but most of the professionals running high level

wides, would want to operate on frequency, and not at the whims of temperature and other frequency determining variables.

> I know it is after midnight, and this may be a knee jerk reaction, but I
> am willing to MOVE. BUT lets all discuss this and see if we all agree?

I agree, this needs to be discussed by the digital band planners in each region. Your proposal affects more than Aprs on 79. You are also asking the fellows running 9600 on 77 to also find a new frequency. Lets keep Aprs on a twenty kHz frequency so we have a chance of going 9600 in the future.

> In conclusion:

>

You plan solves nothing. It creates terrestrial conflict with the neighbors on 77. You of all people, should not promote the interference, harmful or incidental, to other coordinated digital stations.

> * I suggest that APRS stations put out bulletins on their local nets to
> find out who"cant" change their XTALS. Most nets may be able to
> shift over night (plus negotiating driving time to the digi sites from
> their wives).

Bob are you a digital coordinator? May we see your credentials?

> * To prevent overloading both the AMSAT and APRS nets with redundant
> traffic, lets assume that EVERYONE agrees. Only reply if you DISSAGREE
> or have another idea.

I think we should be able to agree as well as disagree in these forums, please do not think you can run the debate one sided. We should be able to hear discussion from either side. The bottom line is Part 97.205 (c).

If you are a band planner everyone must agree!

> * For the sake of discussion, would targetting something like 1 January
> give everyone a target date, either for "doing" or for "arguing", hi hi.

For the sake of discussion, just what is it that is causing you to want to change multiple band plans across the world with out consulting those bodies first? Do you or any of your digital coordinators have any technical complaints of interference? What are these complaints? Has anyone tested with the complainer to see if moving 5 kHz is going to make a difference? Have you investigated other technical means to solve this perceived problem to the amsat system or users?

If it is as bad as you say, why not move down to 71 or 73 or some other digital band plan or coordinated frequency.

For the record, terrestrial packet on other frequencies has worked well with the multiple shuttle frequencies that are in use during flights.

I have no vested interest in 79 or 77 as we use 145.01 for Aprs in a large part of the West. My interest is in proper band planning and coordination. The 79 frequency is a heavily used BBS frequency and 77 is used for multiple dx spotting cluster networks out here. In southern California there are lots of simplex autopatches on 77 and 79.

Lets ask the Aprs folks to contact their local and regional digital and repeater coordinators as listed in the ARRL repeater directory. Lets do this only after we define just what the problems are. You can probably only do this once, before you blow your credibility.

5 kc may not be too much but I know that it is more than just a crystal. In many states 145.79 was fought for and finally approved for APRS ONLY operation by coordination committies. Going back now after establishment and having a state's band plan changed may be difficult, I know 5 kc is not too much but many did not want us to get .79 EXCLUSIVLY ANYWAY, I can just hear the door of opportunity opening now.....

A lot of work has gone into having .79 OFFICIALLY accepted over the years in many states, I would hate to see all of that work go to pot and need to start the whole cycle again. Might also be an opportunity to have a comittiee change our frequency again when need be on their whim, since whe had already do it before.

DO not I REPEAT DO not!! do anything, this is just FYI!!!

I do no not believe this is a good idea with the number of digi's already out there and state coordination. Might be easy to change for some, might not be easy for others with EEPROM programable radios and others with crystals BUT MOST OF ALL it is more than a crystal problem. WE ARE COORDINATED!!!! it took work, is some states A LOT of work to get .79 for APRS use only. In addition to all the digi's we are thinking of how about all the INDIVIDUALS who have stand alone trackers that are crystal controled ?? I have 2 myself but I am sure that there are dozens if not hundreds out there at about \$24 for a pair of crstals, not including the time to tune everything, I do not think that they should be forgotten either.

Let Bob know what you think, as a matter of fact let the sig know what you think ASAP. If you are not on the sig thread send me the message and I will forward it. Let all the other APRS users know about this so we can get this taken care of before it becomes a mess!

Subject: [APRSSIG:4842] CHANGE 145.79?!

Well, I just finished reading the latest AMSAT journal, and it seems clear to me that the 145.80 frequency for future manned spacecraft is pretty well established WORLDWIDE.

Maybe we on APRS should move down 5 KHz to 145.785.

ThIs would give us a 15 KHz split between the users down on 145.77 and the space guys on 145.80. That should work fine, since 15 KHz splits have been shown to work just fine on the 2 meter band with modern rigs.

One further advantage is that most SPACE folks should be encouraged to monitor 145.805 since they will first hear the spacecraft with +3 KHz doppler anyway. Then they can tune downward if they want to track the pass.

Many of us have invested heavily in xtals on 145.79. Probably most XTALS will tune down. Some won't. But now that MFJ is delivering their 5 watt digital radios XTALD on 145.79, we need to make this decision quickly and get on with it. (MFJ finally agreed to STOCK .79 xtals! I don't want to see them get burned...)

I know it is after midnight, and this may be a knee jerk reaction, but I am willing to MOVE. BUT let's all discuss this and see if we all agree?

In conclusion:

- * It will work. It solves the conflict. It supports MANNED HAM radio from space, it will not significantly affect .77 users. It is all-in-all the only possible solution. Some of us may need to re-crystal, but the peace-of-mind will be worth it.

- * I suggest that APRS stations put out bulletins on their local nets to find out who "can't" change their XTALS. Most nets may be able to shift over night (plus negotiating driving time to the digi sites from their wives).

- * To prevent overloading both the AMSAT and APRS nets with redundant traffic, let's assume that EVERYONE agrees. Only reply if you DISAGREE or have another idea.

- * For the sake of discussion, would targeting something like 1 January give everyone a target date, either for "doing" or for "arguing", hi hi.

We have been trying to run a repeater here in Pinellas county with a 15 Khz separation from another repeater in Tampa. Just dosent work. The repeater receiver is a comercialy made radio and when there is any station operating at any power within 10 miles of the repeater site on the other frequency, it makes our repeater useless.

15 Khz separation will not work.

I'm with you Rich. My digi is eeprom programable, but its a pain to
get it reprogramed. There is one person running crystallled controled
in the area, and it would not be good finacialy for him to get new
cyrstals.

We had several hams who made 145.79 and near by freqs there "HOME"
and they moved when APRS became corridnated for 79. They were not
very happy to move the first time, and most likely will not move
again.

I say STAY ON 145.790!!!!

If, in fact, you're filling the entire 30 khz, OF A 10 KHz WIDE SIGNAL, you're overmodulating. Period. Most packet users without test equipment just tweak 'til someone sees data and call it good.

That said, your comment with 9600 is wwell taken. THAT said, there IS no universal bandplan across the US for packet or voice repeaters. Can't be, very well either. Before you guys grab the ARRL repeater directory, I recommend that you peruse it until you find the point that mentions local coordinators.

> Could it be you have a trick up your sleeve? Most sat folks are not
> operating at or near the sat band edges...most serious sat users have
> software to track and aim their antenna. Way too complex to do this manually.

What he's talking about is the move of SAREX to 145.80... as well as Mir's occasional use of the frequency.

> > I know it is after midnight, and this may be a knee jerk reaction, but I
> > am willing to MOVE. BUT lets all discuss this and see if we all agree?

> future.

Point well taken. The use of 145.79 was not well coordinated. We're at a point where we can call on the local coordinators with a reasonable user base and move. And make a case for a unified frequency across the country. IF we work within the system.

> Lets ask the Aprs folks to contact their local and regional digital and
> repeater coordinators as listed in the ARRL repeater directory. Lets do
> this only after we define just what the problems are. You can probably
> only do this once, before you blow your credibility.

OK, folks, here is the challenge: Find your local coordinating body and work with them to GET A COORDINATED APRS FREQUENCY. Impress upon them why it cannot or should not be one of the heavily used packet channels. Maybe, demonstrate it to them. bring some of your public service tracks with you and show 'em on the laptop. Bring a tracker with you and show them that. It's a show-&-tell opportunity. And one that will be giving more credibility to the system.

>DE WB4APR in Annapolis MD.
>
>-----
>My \$.02 worth of comments:

I am not flaming anybody here, just voicing my opinion on this subject.

I would rather not change from 145.79 either. I have 3 EPROM type radios that
are set up for 145.55, 145.79, 145.84R/144.45T etc. and it would cost me
about \$150 to change ANYTHING on those radios.

I also run a crystal controlled rig for my mobile tracker and \$24.00 would be
an optimistic estimate for obtaining crystals for that radio. That of course
does not include the costs of getting it re-tuned if needed.

Another radio is diode programmable so that is not too big of a deal to re-work
and set up on another frequency, but why?

I co-ordinated 145.79 over 2 years ago to be the province wide APRS frequency.
I did this to try to achieve some commonality with the rest of North America,
because I didn't want to see the hassle of having a repeater directory just
to find out which frequency I (or anybody else) should have to be on when
travelling around the country. Besides, I have more than enough money invested
in GPS's, computers, TNC's and the like that the idea of relatively cheap,

crystal controlled or EPROM radios appealed to me. There is a lot less flak from my wife if I can honestly say "That radio only cost \$50 at the Flea Market" as opposed to \$500 or \$1000 for a more modern fully tunable radio with all the bells and whistles. It is overkill to run a modern radio on one frequency for a dedicated purpose. I can't afford to do that, neither can anybody else that I know.

I was approached this past summer to move and I said "Why?" The answer, because 145.79 is reserved for digital modes. I said, what do you think APRS is? Some people have said that 145.79 is too close to the Satellite Band, interfering with Oscar 13 etc. If 145.79 is too close, isn't 145.80 for Manned Missions even closer, particularly when you consider the effects of Doppler Shift on their signal. Why did AMSAT pick such a stupid choice for Manned Missions? I was happy working MIR on 145.55 and the Shuttles on the previously used frequencies. So happy in fact, that I have 3 radios programmed for those frequencies!

The bottom line: I don't want to move from 145.79. If I have to move though, I will, but it had better be to a permanent frequency allocation for this use alone. I have too much invested to change everything at some petty beaurocrat's

slightest whim.

To me, it appears that their is no other choice than to change our frequency, but not 145.785.

Because there is a 4-6 week lead time on our custom transmitter crystals, it would be best to make this decision sooner. When we run out of 145.790 crystals for the VFC400 & HPVFC transmitters, we will offer the new frequency what ever that may be, this should happen around Jan. 1st.or sooner.

Bob, like MFJ we don't want to get burned either, we still have quite a few crystals left for 145.790. and there not cheap either at about \$8 bucks each.

I think you guys are all NUTS! Most of my radio equipment is crystal controlled! Why should I change my equipment to meet someone elses? We have set the frequency at 145.790 both in Canada and the U.S. Now we want to F*** around with it! NOT! It is more trouble to move the frequency to meet the needs of AMSAT. Hell.... let them move..... cause I'm not!

My 2 cents worth!

From: n0vkg@n0eir.#stl.mo.usa.noam (Todd Hartzel)
To: aprssig@tapr.org

Greetings,

Name here is Todd. Here in St Louis Mo we just got 145.790 as the local APRS channel. We were using 144.970 for a long time. APRS is growing here. A WIDE digi was installed in Edwardsville, IL. And one planned for Belleville, IL. Others are being planned for western suburbs of St Louis.

I think it would be a mistake to change 145.790. I'm sure in alot of other regions in country, APRS may just be getting off the ground as it is here Since 145.790 has been used for APRS for along time, and is well established , espeicallly on East coast, and the Space allocations haven't yet begun operations on 145.800, I think they should re-allocate the Space channels.

Keep this in mind, APRS is currently using 145.790 in alot of areas. However MIR and others are using 145.550 and others to-this-day. To-put-it-simple, APRS was there first. I think that future Space allocations should be designed around services already in place <period>. At least in terms of 145.800 <period>. Having those planned for 145.800 put on 145.815 or 145.820 isn't going to be as much as a problem as moving the WHOLE APRS NETWORK off of 145.790

Just remember, APRS is coordinated on 145.790. It is being used for APRS. Its intended purpose. And it is growing rapidly. It is a true network. The MIR and other space services have been using other channels for a long time and are now planning to move to a channel that will cause interference with the APRS NETWORK.

In any case, I got my two-cents worth in. I like APRS. Its popularity here in St Louis is growing. And hope it conrinues. Being on 145.790 as opposed to 144.970 offers alot of advantages here. 144.970 is a packet network channel. Linked into the WAN network here. 145.790 is independant. No packet-network nodes on it. And none planned. Just more WIDE digis.

More poor planning by AMSAT.

>
> Maybe we on APRS should move down 5 KHz to 145.785.

NEGATIVE!... This Violates the Band plans for most regions. More specifically SERA's bandplan. Which I believe the state of Virginia, along with 8 other states, has as their coordinating body. SERA adopted many years ago a 20 Kc (KHz) separation for packet frequencies, on the advice of many Packet users/coordinators in the member states. I regret that use of 145.790 causes problems for AMSAT/SAREX but this was discussed at the first SAREX mission. 145.79 is used daily, 145.80 however is only used during SAREX missions and not on a continuous basis then. So why completely restructure the bandplans for the whole world for a USER (SAREX) who is parttime at best. The easiest cure if it's just 5 Kc's would be for SAREX to move up freq 5 or 10.

Now lets get to the brass facts. Most high profile digis are XTAL controlled. Yes, most can be shifted 5 Kc's but the Xtal's are not nearly as stable in that state. Secondly, XTAL's cost \$25 - \$50 a set. Multiplied by several digi's + time to install and realign the radio's it won't take long to achieve \$\$\$\$\$\$ that could be better spent on improving the network. I have one digi up now, and just ordered more XTAL's for some more radio's a few weeks ago. NOW IS NOT THE TIME TO WORRY ABOUT SAREX, THAT TIME WAS YEARS AGO WHEN 145.79 WAS AGREED TO. AMSAT should have looked at the bandplan's better. Of course they are also trying to coordinate this with the European plan's....that's life.

Bob, I am curious though, how does this tie into your AMSAT/APRS programming you have been working on and tested a couple of missions back??

73, and my vote is NO, and will shut my nodes down before moving to 145.785.

Hi Ken

Nice job on the program, however, is there a bug in the use of the '-' before entering the range? When I used it today the '-' didn't make any difference, just got lots of features and the program bombed out. I tried the mkmapk1 and that worked OK.

Any ideas?

You wrote:

>Maybe we on APRS should move down 5 KHz to 145.785.

I think 15 KHz spacing (between .77 and .785) is just too close for urban
areas for this to work without creating new interference problems.
Consider the direct line-of-sight paths that exist between APRS
digipeaters installed at "real" radio sites and corresponding .77 nodes or
BBS equipment on similar "real" radio sites. I'd be more concerned about
the systems on .77 interfering with the APRS network, since it is likely

that those systems would be running much higher power levels than the typical APRS station or digi.

It would probably accomplish more if we were all to ensure that the APRS network remains a "low power" network by keeping RF power output levels at digipeaters at five watts, and closely watching our deviation levels. Many of us do not have access to deviation meters or service monitors, but there is a way to set deviation adequately without test equipment. Simply monitor the AFSK audio level on another receiver and bring up the level until it doesn't go up any more, then, lower it until the audio level is significantly lower (about 3 dB) than it was at its maximum. It will still work just as good for us, perhaps even better - less RF gets spread outside of the limits of the receiver's IF filters.

Jack

80. 145.80 Manned Space frequency.

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Sun, 3 Dec 1995 22:40:57 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951203211750.3293B-100000@greatlakes>
Rendered body type: text/plain

I guess in my earlier posting I did not explain adequately the "problem". I subscribe to both the APRS and the AMSAT sig and so have been watching the debate over the last two years about the emergence of 145.80 as the only workable worldwide frequency for Manned SPace communications. When I first heard about it, I argued for them to move up 5 kz to be INSIDE the satellite band, but the legacy of 2 years of diplomatic wrangling has decided on 145.80 for a milllion reasons apparently. Here is one stab at a summary:

- * Most of the rest of the world only has a 2 MHz wide 2 meter band NOT 4 Mhz as we enjoy here. The repeater frequency of 145.80 (-600) after years of work, has finally been abandoned by terrestrial users in Europe for the sake of international space coordination.

As you can imagine, you cannot sit down and negotiate a worldwide single frequency with every local coordinating body, they had to work from the top down working with the national organizations. You ask, why not let them use that freq over there, and 145.55 over here?

- * The space stations will be within radio range of just about everyone on earth 6 times a day, 24 hours a day 365 days a year.

- * They complete 15 orbits a day and go completely around the earth in 100 minutes. It is impractical to expect them to QSY every 20 minutes. Yes YOU can do that under contest conditions, but not day-in-day-out for the rest of your life...

So, here we sit on 145.79. The SPACE station will not interfere much with us, but we will surely distroy any practical use of 145.80 for the space stations and for all of us who wish to play with the space stations. That is the "problem". It is NOT today's problem, but it is TOMORROWS problem.

As we see more growth on APRS, we are heading pel-mel toward a collision. YES, moving down 5Khz to 145.785 would mess up most US band plans. And

would squeeze the top two digital channels to 15 KHz channels. But in the long run, having two 15KHz channels is better than losing ONE! (The APRS one!)

Of course the 15KHz vs 20KHz controversy still rages, but in our area, there are 53 two meter repeaters operating on 15 KHz channels quite well. It all depends on your rig. Rather than arguing the emotions, please test your radio. Just tune 15 KHz above or below your local REPEATERS and see if you hear splatter. If you hear nothing, or another repeater, then you have just proved that 15KHz splits work with decent radios. 20 year old radios will NOT pass this test. Most modern ones WILL.

Most commercial services are going to 12.5 KHz channels. IT DOES WORK.

Yes, this 15KHz split channel may force us to a future limit of 4800 baud on 145.77 and .785.. That is the PRICE. But what will be the cost of conflict for the rest of our lives over 80 and 79?

SO. There's the problem. (and what I thought was a solution)... oh well.

Forget the 1 January target date. That WAS stupid on my part. But if you think you have coordinated 145.79, then GO TO YOUR COORDINATING BODY AND ASK THEM WHAT THEY ARE GOING TO DO ABOUT THE IARU INTERNATIONAL COMMITMENT TO 145.80. More than likely nothing. And we are going to get burned in the long run...

I intend to put up a 6m station for the ms event here is my idea
so flame away. hihi

does any body out there have any problem with 50.62 Mhz as recommended
in the docs of aprs?

would it be a problem if the speed was only 1200 baud as this could be
done easy as pie for me and many others who have 6m radios and 1200 tncs
My station can consist of an azden 50w and a 1/4 vertical will this be enough
power/gain for this event or am i spinning my wheels?

I have talked to a nother station who may be able to put up a 6m station
at a high site for the event as well in atlanta ga (im in athens 70 to
the north east)

if anybody can also tell me the date of the event as i have not heard
any thing about it for a week on the sig that will give me an idea if
this is do-able or worth wild
thanks Lynn n4yci at Univ of Georgia

As far as a freq is concerned 145.790 is a co-ordinated freq.
In Canada it has been used by other packet modes before
APRS came along and to do away with any problems with
co-ordination across this Country.
When CRRL set up the Canadian Frequencies it was decided
to chose a freq for APRS that did not effect any other packet
system in use. It was mutually decided to use 144.390, as
NO other packet stations were using it and make it an
exclusive "NATIONAL" APRS frequency CANADA wide.
The "Ontario / WNY Packet Advisory Group" led the way
in this decision.
Ontario and Western New York are have been using 144.390
for the last year for APRS.
If you are going to move your 145.790 at all let it be to a
co-ordinated frequency, that is NOT being used by anyother
packet or FM mode. Might I suggest doing as Canada has
done and move down to 144.390 across all of North America.

This is my 2 cents worth, and please forgive the VE6's use
of foul ****'s

Subject: [APRSSIG:4861] Re: CHANGE 145.79?!
Date: Sunday, December 03, 1995 2:34PM

Bob as you well know the problems i had getting 145.790 coordinated here
in North Alabama it took all of 16 to 18 month's to convince the thick
headed
hams around herethat APRS was usefull and should be just as much a part of
ham radio then any other digital mode. You know you heard part of it
traveling
through this area during your trip to Florence i'm not about to go through
that
again after those thick headed hams finally agree that YES maybe APRS does
work and does have more users then just KE4EER that new ham in
Hazel green. I haven't had any complaints about it being to close to another

frequency to cause interference. Really i always get told by digi owners in Alabama 145.790 doesn't need to be coordinated so maybe those users will vote for the move, but i have coordination papers for North Alabama and don't want to change.

So i Vote STAY on 145.790

Bill KE4EER

85. Frequency Change???

To open another can of worms, RAC (Radio Amateurs of Canada), recommended that 144.390 be used as an APRS frequency in Canada. At this point we cover about 1/2 the width of Ontario (300 miles, Buffalo, and North about 80 miles out of Toronto. We are all on 144.390.

The other thing to consider is: Is the AMSAT plan set in stone. If you let them know that 200 digi's are on 145.790, in North America, they might reconsider their plan.

regards...mike

DO NOT MAKE THE CHANGE - change will be very detrimental to the continued growth/acceptance of APRS - one bone of contention with many other spectrum users (i.e., voice & packet) is our need for an APRS frequency. It is doubtful whether the change will have a significant impact on a perceived problem.

I am in Huntsville ALA
the freq 145.010 is used
the freq 145.090 is used
i just bought a mfj data radio just for APRS spent the more money
to get on freq for APRS , I thank it is a very big mistake to give up the
freq 145.790

THANKS

Gary and I are coordinators. We can pass your messages to the
coordinator's remailer.....

What do you want?

Ther is NO country-wide band-plan. If you need something NOW
is the time to ask for it - before there is mandatory (whatever).

Let us know - we really want to help.

If the SAREX coordinators were informed of how much activity there is
now on 5.79 APRS, perhaps they would consider using .80 as a secondary
or emergency only downlink. Last SAREX, all I heard was activity on
.84, anyway. As for MIR, they seem pretty happy on .55 at the moment,
especially with the new 440 gear on board.

Has someone on the sig contacted the SAREX coordinators with good data
about the rapid spread of APRS and the probability of interference
with the 5.80 downlink? Do we need to "officially" sanction a
national APRS spokesperson?

One last comment - we should in good engineering practice make sure
that all of our digis have the minimum possible deviation consistent
with reliable operation. That will certainly go a long way toward
minimizing problems should we remain on .79, and make us good
neighbors in the spirit of ham radio anyway. Borrow a dev meter and
make sure!

I vote no on the move, but will do what's best for APRS, xtals or no.

Any chance of making the COM buffers configurable -- so that those with more memory than they know what to do with can make use of it? Or is that something that's hard-coded into the language COM services?

>
> Most commercial services are going to 12.5 KHz channels. IT DOES WORK.
>
d

Our experience here in Pinellas County is that 15 khz spacing will only work if there is at least 20 miles separation between receiver and transmitter. Our problem with our repeater spaced 15 khz from the Tampa machine is not the repeaters themselves, but with users who our working the Tampa machine within 20 miles of the Pinellas machine. The result is splatter making the Pinellas machine unusable. 15 Khz will not work with close spacing, and you will have close spacing on packet channels

> STOCK .79 xtals!
> I dont want to see them get burned...)

I currently have 1 digi up and running one that should be up within two weeks and another that I hope to have up before the end of the year. All of the radios and TNCs have been aquired and only antennas and feedline are the last issues to be completed. Retuning these at this point would not be a trivial matter. This does not take into account the standalone and other mobile trackers. While I know that the whole country is not on 145.79 MHz for APRS, everyone around here is and more and more people are joining in. It would seem to me that the space users should rethink their position. I will agree that I do not have all the information needed to be firm on my position but with what I have now I think that moving APRS to 145.785 MHz would be a mistake and would affect more people than the space user community having to move over a little.

That's my opinion, oughta be yours. ;{} (hi hi)

When we started trying to migrate out of the general use band segment and toward the Space segment, APRS was a very small, and non-accelerating, portion of packet. I have seen significant interest growth and utility evolve over just the last 6 months. Over the last year, it's been pretty phenomenal.

SAREX has had to contend with DX Clusters, complaints from BBS's and with the European standards that we violated. AMSAT negotiated a plan internationally that will work. It took time, effort and money to get it accomplished. It's not likely to change because of 200 digi's, or so.

All in all, Mir's crews are busier over the long haul than the shuttle crews, with some notable exceptions. Also, the Shuttle crews have a better grasp of how to manipulate their radios than the guys on Mir. N6JLH spent months working out a set of frequencies for Mir to use besides 145.55, and training them long-distance to make the frequency changes. Get a grip: These guys are sharp, but ham radio's not at the forefront of their lives.

Better yet, borrow a service monitor and make sure it's ALL set up right.
This point is well taken. I've heard folks on here claim they were filling a
30 khz segment of band with a 1200 baud packet signal. This is indicative of
a problem. For the record, SAREX is configured for 2.5 khz deviation and
works fine. Audio inspection of a number of the TNC setup's around here
suggests they are overmodulating, which is actually a testimony to the
demodulators, and says little positive about the way the rigs were configured.

95. 15 kHz spacing and APRS

From: n4uls@ix.netcom.com (Jack Anderson)
Date: Mon, 4 Dec 1995 10:00:18 -0800
To: aprssig@tapr.org
Message-ID: <199512041800.KAA25187@ix3.ix.netcom.com>
Rendered body type: text/plain

Regarding an earlier comment that 15 kHz spacing works fine for
repeaters, etc., there is a reason that it works. The coordinating
body uses criteria for co-channel and adjacent channel separation to
help prevent interference. Systems destined to operate on adjacent
channels must be separated by a certain distance to prevent adjacent
channel interference. Yes, packet could work as well, but stringent
adjacent channel separation guidelines would need to be developed and
followed. We would not have anywhere near the degree of flexibility we
enjoy now when placing digipeaters on the air. It's possible that home
stations may need to be coordinated as well.

Another problem - repeaters use frequency pairs separated by 600 kHz.
This makes it impossible for a *repeater* to interfere with another
repeater. In repeater frequency coordination we are more concerned
about adjacent channel interference from a nearby repeater to mobiles
and portables operating on a given channel. But, with packet, just
about everything is simplex. Simplex packet digipeaters and nodes
located at good radio sites stand a much better chance of creating
adjacent channel interference to each other, since now we're talking
about "base to base" interference instead of "base to mobile". The
path is now a line-of-sight path with much less attenuation.

Jack

=
=SPARTAN PACKET RADIO EXPERIMENT (SPRE)
=====
=
=General Information (long)
=
=By: Ken McCaughey (N3FZX)
=File: spre02pr.txt
=Date: 29-Nov-95
=
=
=The Spartan Packet Radio Experiment (SPRE) is an Amateur Radio (HAM radio)
=communications experiment. The primary mission is to test satellite
=tracking using amateur packet radio and a Global Positioning System (GPS).
```

=SPRE was developed and built by the University of Maryland Amateur Radio Association (UMARA) with assistance from NASA, volunteer engineers, and volunteer software professionals.

=

=SPRE is one of four experiments on NASA's Spartan/OAST-Flyer spacecraft.

=The Spartan spacecraft is scheduled for launch on January 11, 1996 aboard the space shuttle Endeavour as part of mission STS-72. The spacecraft is a cube shaped, battery powered, retrievable satellite. Spartan will be deployed by the shuttle's robot arm and likewise retrieved after approximately 48 hours of free flight.

=

=

=Mission Objectives:

=

- =* Promote amateur radio and amateur satellite communications.
- =* Test GPS and packet radio based tracking system using a Low Earth Orbit (LEO) satellite.
- =* Provide an educational tool to inspire elementary and high school students to pursue science and engineering.
- =* Provide a unique hands-on educational opportunity for college students.

=

=

=SPRE is designed to relay ground station positions and transmit telemetry containing the GPS location of the spacecraft and housekeeping data. The GPS data is generated by another Spartan experiment.

=

=Special software called APRtrak (tm) will be used at SPRE ground stations to plot the positions of stations and objects world-wide using SPRE transmissions. APRtrak uses full color maps and graphics with the capability to display detail maps of selected geographic regions. Amateur radio ground stations can transmit their locations to SPRE, and if heard, SPRE will relay GPS information back to Earth. All ground stations within range of SPRE will see the relayed stations plotted at the on the map at the correct geographic location. The APRtrak software will also decode and display SPRE housekeeping telemetry including temperatures, voltages, and system status. This software is freely available on the Internet for installation on IBM compatible computers.

=

=This technology has many applications in the amateur radio as well as the commercial worlds. Low cost Low Earth Orbit (LEO) satellites could be used to track storms, weather balloons, boats at sea, trucks, etc. Satellites could collect the location data from ground targets and download it to ground control stations. If the SPRE mission is successful, this capability may be incorporated into future amateur spacecraft, thus supporting the amateur's effort for technological improvement.

=

=The operational aspects of SPRE will include amateur radio operators throughout the world. Elementary and High Schools are encouraged to enlist the aid of local amateur radio operators to set up ground stations and participate in the SPRE experiment. SPRE can be used as an educational tool in many classes including math, science, and geography.

=

=SPRE can still be used as an educational tool even if a school is not in session during a fly-over. A simple amateur packet radio station can be configured to listen to the SPRE telemetry and record the data for later study.

=

=Amateurs and schools who participate are encouraged to send the data they collect to the SPRE Project to help to piece together a composite picture of the mission. The final results will be made available to participating schools and the amateur radio community.

=

=SPRE will use a ground control network, SPREnet, consisting of specially equipped amateur radio stations to distribute data via the Internet.

=These control stations will monitor the health and activity of SPRE.

=

=In addition to the amateur radio experiment, the SPRE system will forward to Earth a sampling of real-time telemetry for two of OAST Flyer's experiments: REFLEX and GADACS. Spartan is equipped with on-board recorders to capture data from each of the experiments. Traditionally, an experimenter must wait several weeks to receive the mission data. SPRE provides a low cost, innovative solution giving experimenters the opportunity view a small sample of data during the mission while advancing amateur radio satellite technology.

=

=The sample REFLEX data from the mass spectrometer will be used by the experimenters to provide feedback on how well their experiment is performing. SPRE will be providing GPS location and time information from

=the GADACS experiment. This information will provide some insight on the
=health of the GADACS GPS receivers as well as indicate the current
=location of the Spartan satellite. Using the APRtrak software described
=above, amateur radio stations and schools will be able to observe the
=track of the satellite as it passes overhead.

=
=Data is transmitted on a downlink frequency of 145.55 MHz. This is the
=same frequency used by the MIR space station and the Shuttle Amateur Radio
=EXperiment (SAREX). The data format is completely printable ASCII
=characters and therefore is fully compatible with all amateur packet radio
=equipment in common use today.

=
=All of the hardware and software has been designed and constructed by
=students and volunteers. This low cost project has provided a great
=hands-on opportunity to gain experience in space communications. So far,
=several students have earned college credit for their work on SPRE. It
=has also helped some graduating students secure employment in the
=aerospace industry.

=
=
=
=
=Information Summary
=-----

=Mission: STS-72, Space Shuttle Endeavour (OV-105)
=
=Launch: January 11, 1996 at 09:18 UTC (60 minute launch window)
=Orbit: 28.45 Degrees
=
=SPRE Deployment: 3 days 2 hours mission elapsed time
=SPRE mission: Approximately 46 hours
=
=Operating Mode: FM, AFSK 1200 baud packet radio
=Frequencies: 145.550 MHz Simplex

Hi Aaron

Did anyone supply input from Alberta when we had 6 months of data collection going on. We wanted to know what was in use Canada wide, and I don't remember hearing about Alberta using 145.790. As for Eastern Canada, it growing in leaps and bounds on 144.390.

Finger pointing aside, how many digi's are on 145.790 in Alberta?

regards...mike

A point I haven't seen mentioned yet:

Which is more useful to you? Having amateurs talk to the astronauts or having an APRS network that could be used in emergencies, public events, etc. Seems to me that the amateurs that contact manned space operations pretty much do it for the thrill of the contact. I vote in favor of a useful APRS network.

I don't know about that ... most of the time I operate packet anymore it is mobile.

ERGO IT IS USELESS! The Magellans started me on the entire APRS concept when their first boards came out. They lead the field, they soon got the contract for all JAPANESE car makers and have an excellx\ent product, but to make it fit and to meet the Japanses Specs, they dropped NMEA. Stupid move. WWithout NMEA, their GPS is worthless for APRS, unless you want to add a mircorporcessor to convert their format...

I don't think anyone took the time to let RAC know what was going
on. APRS then was not a big issue. As of today, only a select few have
delegated their time towards APRS. However, we as the select few do wish to
stay compatable with the US.

Gentlemen,

I understand there is some, and will be more, discussion on this subject.

Furthermore, since this issue relates to packet radio (man, am I going to catch it for this comment?..), we will probably see many 'flaming hot' messages on the subject from those who have strong feelings, and those who primarily utilize text transmission (writing) to express and vent their anger and frustration.

We do have to realize that this is one of those issues relating to a conflict between the ARS and ASS. These terrestrial vs. space questions are going to require some coordination and communication between the interest groups representing these services.

Though healthy commentary on these issues is certainly encouraged, I think this is an area where the (cough.. cough..) ARRL needs to exhibit it's capability to 'troubleshoot' the situation before it becomes a problem. This is where the League's SMC can, and must, become involved; in planning issues such as this.

In the end, we should all endeavor to use reason. The use of wisdom, knowledge, and understanding is the key to the resolution of problems. We all want it now, instantly. However, It won't be quite that easy.

First, let's have the wisdom to recognize the problem. Let's obtain the knowledge to work the problem. And, finally, let's have the understanding to implement correct and proper change to solve the problem.

Let's all (...the SMC too!) use communication to enhance knowledge.

More than just a tool, communication is a process!

73!

Well, its over. The AIDS awareness day walkathon has concluded and here is what we learned.

#1 A program that runs on a newton or one of those hand held graphics pads would be STUNNING ! Laptops are too big to carry.

Imagine, you could walk around with race organizers, and show them where their people and resources are. Also, could plunk it on the dashboard and use it as a moving map display while driving. The computer in the car works fine, but we cant lug a laptop around while walking around the park with the race bosses. Can anyone do this kind of software?

#2 Having APRS reduced our voice traffic 90% ! Each ham knew where everyone was without resorting to asking.. Just look at the screen!

#3 We needed a TOTALLY portable APRS machine and KC4NMY came through. His GPS/APRS/TNC/HT/Seismograph/Gieger Counter box with Built-in antenna and decoder ring came to the rescue ! We just handed it to one of the vehicle drivers and there he was on the map. James Bond look out!

If we wanted to change the xmit rate or whatever, we just connected to the KPC and changed what we needed.

The guy in the truck didnt have to operate it at all !!

As it turned out, we did need to access the portable unit and we were able to change parameters during mid race !

#3 Everyone shaved! I made these little ID cards and distributed them to everyone. It had call sign, name and Radio operator on it. Looked like a backstage pass. It was secured with a lanyard around the neck. Amateur radio fashion at its' best. Really looked professional (I thought).

#4 Having a mobile home as our base of operations was terrific! We could load it up with our goodies (radios, extra batteries, food/drink) and swing by it and restock. The generator and big batteries didn't hurt either.

Now the BAD STUFF.

Not one of the race organizers asked to see our APRS display. That's why something more portable would be great.

That's it ... that's the only bad thing.

On a personal note...

Seeing those people walking was very touching. IT would rip your heart out. Scenes like:

The 4 year old boy, paralyzed on the right half of his body, strapped to some kind of walker device, dragging his crippled body, smiling and happy as he crossed the finish line with the crowd cheering and his parents lovingly helping him cross the line was one of the most profound experiences of my entire life.

Or the wheelchair guy who took an extra hour (or was it 2 hours extra) to cross the finish line. He nearly toppled over on the speed bumps in the road. But he didn't stop. HAM OPERATORS were there, (when most of the race organizers had already left) at the finish line. Credit to K04HD who had to drive his van .003 miles per hour behind the guy for over an hour)

I would like to publicly thank the following operators for their help. We asked them to arrive a 6am on a Sunday and they were there, I am very proud to be their friends...

While I am not in favor of moving, I now understand a little better the ramifications with the space folks. For me, a move to 144.39 would be infinitely more feasible than a move to 145.785. If we are going to move I like this idea best.

To: aprssig@tapr.org
Message-ID: <199512050533.AAA20780@borg.mindspring.com>
Rendered body type: text/plain

Bob-

I have located a possible bug in Mapfix. It shows up in (at least) versions 16 and 17.

I was using the program to make 1 mile Atlanta area maps when I noticed that the lat/long display box was behaving strangely. The problem involves the data on the left side of the box (the side with the degrees, minutes.tenths of minutes)

When cursoring up from 33 degrees thru 34 degrees, the calculation is way off just above 34, 0.0. Just after passing 34 degrees, the display reading varies between 0 and 9 minutes, then goes back to less than 1 minute, then begins incrementing normally.

I tried several other similar places where degrees clicked over and this was the only place I noticed it.

To test this, place your cursor just below 34 degrees, zoom all the way in and move the cursor up. You'll see the problem.

Well, apparently my idea to solve the future problem with SAREX and Space station on 145.80 by moving APRS down 5 Khz has met with overwhelming opposition by everyone. Most vociferously the folks on 145.77 who dont want to have a 15 KHz neighbor on 145.785...

No one, especially the most contemptuous responses offered any other solution other than "IM NOT MOVING"...

Oh well, seemed like a workable compromise to me...

In view of the explosive growth of 145.79 networks, it will be impossible to fix this problem later. Maybe the possibility of moving the SPACE STATION up to 145.805 should be re-addressed...

Dick Smith in Tennessee just made me aware of someone listing 50 or so MAXAR-80 transceivers for \$50 each. These are good quality commercial radios with helical front ends. They are single or dual channel crystal controlled. They tune to 145.79 but he doesn't think they will all reliably go as far down as 145.01,

When I called today, he only had about 10 left. I don't have one and am not getting one, since I already have more commercial junk lying around than I can ever get tuned up. But if anyone is building a digi, these sound great. Call Henry Hamblin at 606 528-8961 somewhere in Tennessee I think. He ships them for about \$6.50 each...

> useful APRS network.

Oh. I'm sorry. You could be right. If you had your facts right.

The primary reason for SAREX is not for the HAMS to talk to the astronauts. It's to provide a unique educational and motivational opportunity to school children.

Listen up, guys. There is no reason why Manned Space activities, which predate APRS *AND* Packet, can't co-exist with the rest of ham radio. I can speak for SAREX in saying that they've gone a long way toward coexistence by trying to accommodate a number of complaints about the SAREX frequencies by relocation.

Let me talk technology here for a while. And bureaucracy.

1. the SAREX radio routinely manifested for flight is a Motorola MX-300 series radio. It is EPROM-tuned. For reasons of reliability and quality assurance, SAREX has the programming done by Motorola, in Plantation Florida, shipping

all flight radios and training radios back to the factory for checkout. Upon their return, someone has to test and verify, under written test procedures, that all the radios are really on the frequencies they're supposed to be.

Did I mention Flight Hardware? The 2-week process associated with shipping Flight Hardware is something to behold, too.

Selection of frequencies for use is a subject that must be approved within the NASA community, as well. Since there is not a spare Orbiter with all systems intact at NASA/JSC, most of the determination is based on analysis. If a potential problem is determined, the easiest way to fix it is to tell SAREX "NO." In point of fact, this has happened on several flights, where unpredicted malfunctions occurred. Until some determination of the real problem evolved, SAREX was off.

Selection of frequencies is also an international effort by ARRL and AMSAT. While I hesitate to use the terms "nationwide" and "bandplan" in the same sentence, in some cases, it's appropriate. Space is coordinated by treaty agreement from 145.800-146.000 MHz. Depending on regional bandplans, repeater inputs start at 146.01 or 146.02, in the US. In other portions of the world, the entire amateur allocation for 2 meters is 2MHz or less, frequently ending at 146.00. It's been over 2 years in the making, to get a new set of allocations for manned space operations. Oh, and while you're commenting on how happy Mir is with 145.55 operations, please recall the two reasons THAT was chosen: 1. SAREX had established a 145.55 MHz downlink back in the dim recesses of history, when Owen Garriott, W5LFL, flew on STS-51C, AND, someone had preset the original Mir radio to that frequency, and the Cosmonauts didn't have to change it.

There was serious complaining about Mir's use of SAREX's "channel" when they came up the first time! (Not, I might add, from SAREX) But upon the return of SAREX to operation with STS-35, in 1985, a real firestorm erupted: The DX Cluster community was all up in arms that the "newcomer" operation, SAREX, had stolen their channels! (SAREX uplinks had previously been 144.91-144.99, with a preference for 144.95 to preserve the utility of a .6 MHz split) Over time, the community and SAREX reached a truce: SAREX is only overhead for brief periods, and was not demonstrated to really screw up their operations...

Telling Manned Space operations to move AGAIN is not likely to help much. There is significantly more mass there to get moving than there is with APRS. Personally, while Bob's suggestion has merit for altruism, I do not think there is a hard technical requirement for moving IF we make sure our radios and TNCs are set up properly.

119. Baycom tnc in a connector

Date: Tue, 5 Dec 1995 09:28:20 -0600
To: aprssig@tapr.org
Message-ID: <199512051528.JAA11408@OAMPC10.csg.mot.com>
Rendered body type: text/plain

Does anyone know if it is possible to use a Baycom TNC in a connector with APRS? I think this question was posed a while ago, but I can't seem to find an answer. Even if it could be made to work RX only would be ok.

Paul, WD9ABE

120. Re: [APRSSIG:4825] Re: GPS simultaneous parallel tracking

As I remember, the EPROM style PIC chip (16C54) is about \$20. The write once type is below \$10. The Intel 87C51 (w/EPROM) costs about \$30. The advantage to the 87C51 is that it has serial hardware. On the PIC chip you have to meticulously program the serial timing. The PIC documentation has some routines to do either input or output, but I don't recall any simultaneous input/output routines as would be needed for a translator device. With both parts, you still need a serial transceiver to produce the correct serial voltage levels.

BTW, I have a PROM programmer that can program both the PIC and Intel devices.

```
>> <I Previously wrote...> <snip...>
>> Your best bet would probably be to build a translator device that
>> translates your GPS's output to the NMEA codes. There are some relatively
>> cheap single board computers ($150) that could be programmed to do the
>> needed translation. If you are a little more industrious, you could put
>> together a simple board with a microcontroller (87C51--has built in EPROM
>> and serial output) and a serial transceiver chip.
>> If you send me the format of your GPS's output, I'd be willing to look
>> at it and give you more feedback. If you e-mail me, don't expect a reply
>> until after Monday--I'll be out of town.
```

We're on 440 here, 1200 baud, going through a couple of existing packet digis which are on a 9600 baud (or 19200 baud) backbone. But that's just for testing (yes, we know that the backbone takes away some APRS capability, but we have no choice at the moment!). We're just getting started here in Germany, and are still pondering what to do about finding a frequency for us. First we've got to get more people on the air with APRS here, so that at least one APRS station can hear at least one other directly!

I got a message from DF2DR once explaining why almost none of the recommended APRS frequencies in the U.S. will work in Europe, so any hope of an international APRS standard frequency list (even on HF) went right out the window. :-(Unless the international APRS community is willing to start all over again...

Is there anyone who does NOT get a headache when working on a freq. coordination problem?

Rendered body type: text/plain

Aloha all. Ted/NH6YK, pilot extraordinaire, and I, Dave/WH6YC, beachgoer regulare, will be aeronautical mobile around Oahu next week one day, Dec 11-15, with APRS onboard. We will uplink occassional position reports to HF. The flight will be coincident with a band opening on 30M, which usually starts about 1700 west coast time. We will uplink thru our local WIDE digi, and encourage acknowledgement by short one-liner. We intend to videotape the event for playback at an upcoming ARC meeting. FYI, the WIDE digi on Oahu will move soon to atop a mountainridge above Waikiki and Waimanalo, at 2700 feet. We're curbing output on the 100watt radio so as to not interfere w/the satellite subband. We'll call our presence on 145.79 as "established" vice coordinated. I don't know if we do that coord stuff over here. Honolulu Marathon is this Sunday, December 10th. We have 3 APRS trackers for the Lead Male, Lead Female, and primary Doctor transport vehicle, and will be using APRSDR to track the Lead Wheelchair, course record, and pack. Wish us luck. Must be snowing on the mainland, cuz I feel like heading for the beach. Aloha, Dave.

A Baycom is only a *MODEM* not a TNC. The TNC-like functions are handled in the software running on the PC connected to the MODEM. APRS requires a TNC. Unless Bob wanted to add MODEM drivers to his code, which I feel is unlikely, the Baycom is not going to work.

TNCs are small enough now, and reasonably priced e enough (See the Pico-Packet from Paccomm) that I seriously wonder why anyone would mess with a Baycom type device now anyway. But I have one if you know anyone who wants to buy it.

I made another stab at band switching the AEA dual ports. It is betab.exe and is zipped up as betab.zip. Again, it would NOT upload to my internet server with Kermit. So I posted it on 410 280-2503 BBS.

It also should solve the garbled call problem seen in Germany...

betab.exe will identify itself as 74.d, but it is NOT (yet).

If you have a PK-900 or DSP-2232 please see if this version does properly band switch. You MUST start betab.exe from scratch so that it can ask you about your TNC...

130. New *HIGH* APRS DIGI for NC /TN / GA

From: rwf <rwf@mindspring.com>
Date: Tue, 5 Dec 1995 13:17:35 -0500
To: aprssig@tapr.org
Message-ID: <199512051817.NAA15546@borg.mindspring.com>
Rendered body type: text/plain

For those of you keeping track, or planning travel to the area, we have placed a new APRS digipeater on a 4800 ft hill in extreme SW North Carolina.

The digi is located at Andrews NC and has already shown that it can connect directly to Columbus, GA, Birmingham, AL, Atlanta, GA, Huntsville, AL and all of the other Digis in TN except for Nashville. The other packet digi on the same site connects easily to southern VA as well, so if APRS gets active there, we may have a path. Yes, Bill KE4EER can work it direct from 153 miles away in Hazel Green, AL. Haven't yet tested the range to the beach in Hawaii, yet though :).

It's an easy hop over to the DIGIS in the Knoxville area that already serve middle/east TN so well, but don't do much for NC due to mountains like this one.

It is currently a WIDE-RELAY and I will list the beacon text below so Bob and Keith can add it to their lists.

Hardware is a GE MVP running 25 watts into a db Products pass cavity and 9913 feedline into a Hustler G-7.
Commercial equipment and pass cavities make for GOOD ham radio neighbors!

N4NEQ-3 !3404.03N/08427.29W#PHG5870/WIDE-RELAY in SW North Carolina 4800'

Thanks to KE4CTS KD4DKW and WD4JEM for their assistance on the installation, and W6PNC for range testing from Atlanta.

Why don't they use 440 instead of 2 meters. Seems to me that uhf
 would be better suited for space communications than 2 meters.

I was able to get in after two attempts at 1750 UTC. The transfer seemed
 like it was
 going to run a little slow, but then picked up to its usual speed and
 completed.

Maybe there was extremely heavy usage today..

133. 144.390????

From: "HOLCOMB, GREGORY FRA" <LYNN4YCI@MUSIC.CC.UGA.EDU>
Date: Tue, 05 Dec 1995 12:58:07 EST
To: <aprssig@tapr.org>
Message-ID: <05DEC95.14006290.0048.MUSIC@MUSIC.CC.UGA.EDU>
Rendered body type: text/plain

I have a question about 144.390 im not saying move or dont move im just asking for more info b4 i "cast my vote"

1. What is it used for in the US now?
2. If a move was made could we go to 9600 at a later date?
3. Would we have the power limmitions that i hear so many of you talking about?

(digis with 5 watts dont work in the athens/atlanta area and mobiles runing less than 10 watts dont work very well at all)

4. I know that the cost of making modifications to radios would be expensive but what are the long range benefits and would it be beter to move now vs. moving when we have 3 times the users and digis?
5. Is there a possible national cordinations on this (144.39) frequency?ie having every body on the same frequency would be a much beter situation

thanks Lynn N4YCI at Univ of Georgia.....HI KIP!

134. Re: CHANGE 145.79?!

From: Steve Dimse <sdimse@bridge.net>
Date: Tue, 5 Dec 1995 13:54:14 -0500

Message-ID: <199512051854.NAA25369@brickell.bridge.net>
Rendered body type: text/plain

I think everyone is very much over-reacting to the present situation.

1. 145.800 is one of three freqs listed.
2. Even if it were the only one, there would be QRM to 145.79 for a few minutes at a time, several times a day. Not a 24 hr a day problem for us by any means.
3. The QRM from APRS to MIR will be far greater, since APRS consists of automated stations which will not be able to be shut down during a pass. I doubt they will continue using this freq over the US once they hear what it sounds like up there.

My opinion, for the little it is worth, it to leave things were they are. If we move, next week someone may try to put something on 145.78!

135. Re: [APRSSIG:4897] Mapfix Bug

Is always been there. MAPFIX doesnt handle well the leading zero of the decimal portion of the minutes. So 39 27.015 will look lilke 39 27.15.

Sorry, but at these fine levels of detail, I guess it is going to be of concern.

BUT THE NUMBERS ARE CORRECT, only the DISPLAY is off. So in the vicinity of an even DEGREE, just move the cursor slowly and you can figure out how many leading zeros may be missing after the decimal point... TNX...

I have also noticed this bug. It doesn't seem to affect Mapfix but it does make it hard to locate a point to enter into Mkmap. I have also noticed that Mapfix eats points when a map is loaded into it. This causes the stairstep problem.

Rendered body type: text/plain

Bruce-

I have been using a Procomm Tiny-2 for a year now and I can offer these pointers:

When setting up the TNC for APRS transmit using a GPS receiver w/ NMEA-0183 outputs, you need to at least set up 5 commands. MYCALL should have your callsign (w/ optional SSID if desired). GPSTEXT should contain the NMEA data sentence such as \$GPRMC or whatever. LPATH can be left with GPS (default) or some other destination callsign. LOCATION EVERY N should set your periodic transmission rate every N*10 seconds. Lastly, GPS should be set ON, in order to activate the TNC as an APRS tracker. It should be noted that these commands should be sent to the Tiny-2 in UPPER CASE only-- it will ignore lower case inputs.

If you suspect your problem is communicating with the GPS receiver, verify what baud rate the GPS unit is sending at. The NMEA standard is 4800 baud, but newer units may transmit at 9600 baud. You can change the jumpers inside the Tiny-2 to accommodate the correct baud rate if necessary. Also, be aware that both the TNC and GPS receiver are considered as DCE devices. While you may be able to read the output of the GPS unit on a DTE device (i.e. computer or terminal), you may need to use a null modem adapter to connect a DCE device to a DCE device. What I do is install a mini DPDT slide switch inside a DB-9 connector shell of my connector cable to switch the RD and TD lines as required.

If you suspect your problem to be on the receiving end using the Tiny-2 as a standard TNC, I have found the TNC front end very sensitive to overloading or underloading from the transceiver. While the TNC's DCE light will come on for each packet burst, there may be no data being transmitted on the RD line going to your computer. I find that installing an in-line RS-232 mini-tester will aid in setting up the receiver volume level to an optimum point. I hope these pointers help.....

I absolutely, positively, agree on this one.....SAREX goes up for a few
days every few months...and passes overhead 3 or 4 times a day for no
more than 10 minutes...and we are talking the downlink freq not the
uplink freq...the SAREX astronauts won't hear it at all....

P.S. What was wrong with 145.55 anyway....only a problem during joint
missions....

Just my two cents worth

Does anyone know if it is possible to use a Baycom TNC in a connector with APRS? I think this question was posed a while ago, but I can't seem to find an answer. Even if it could be made to work RX only would be ok.

According to the ARRL Operating Manual...the ARRL bandplan places 144.390 smack in the middle of the Oscar subband in the US...in Region 1 it would be 10 KHz away from the SSB meteor scatter freq....so there is the answer...why as why?

> problem.

APR REPLY: There is no mechanism for APRS to eat points EXCEPT for the alt-SCRUNCH command. If you see a grainy resolution, then you have selected a VERY wrong map scale (PPD) value. Im not sure how the PPD is selected in MKMAPHK, but when you view ANY map with MAPFIX, the OPTIMUM map scale is shown as a yellow BOX. All or most of you points should be inside this box.

If you have a vey BIG yellow box, and a tiny map, then the PPD value is

way to big and you have lost resolution. If the yellow box is too small, and most of your map is outside of the yellow box, then you have TOO MUCH resolution for that size map, and your MAP numbers will be TOO big. This will lead to APRS crashes when you ZOOM in too far.

The yellow box marks the 0,0 origin in the upper left corner, and the size of the box represents map values between 0 and 1024 vertically and between 0 and 2048 (somewhat less actually) in the X axis. If you values remain in that range, then 1) your map will NOT crash in APRS and you can use the MAPFIX COMPRESS function to reduce the size of your map files.

I see a lot of manually made maps with GROSSLY wrong PPD selections. In MKMAPHK and MAKEMAP1, I think the program selects it for you...

Well, last I checked, First Element Launch for Space Station (R)Alpha is due *NEXT* year, and Permanent Manned Capability in 18 months. So, they'll have 2 space stations up then. Therein, some of the basis for the prior planning.

Message-ID: <951205223229_45857143@mail04.mail.aol.com>
Rendered body type: text/plain

For you APRS mapmakers, I've uploaded a corrected version of MKMAPKKE to tapr/SIG/aprssig/uploads as MKMAPKKE.ZIP. Hopefully this corrects the bug where the + & - did not work correctly. I cranked out a couple of maps with MKMAPKKE and MKMAPHK1 and they now appear to work about the same as far as picking up the correct roads. Read MKMAPKKE.TXT when you unzip the package for details.

I've got Barbara's (KK6IB) and Ralph's requests for tweaks in the "to do" list after all of you find the next set of bugs! Also, I'm trying to figure out how to shed some of the contour lines or points and still keep a reasonable representation of the elevation data.

Are there any railroad history buffs out there? While trying to chase down the last set of bugs in MKMAPKKE I noticed there are several map feature categories under "railroads" that might be interesting; "abandoned", "dismantled", and under the road category, "old railroad grade".

If there is any interest, I could add these to the menu for MKMAPKKE. In Oregon, the hunters often use the old railroad grades for hiking access into the mountains. Not necessarily an APRS application, but this historical map data might be of interest for specialized applications.

As one who flies the larger birds, here's my 2 pennies on the discussion about GPS instrument approaches.

To my knowledge, the GPS aviation instrument approach is still published as just a non-precision approach. That means there is only lateral navigational capability, with no vertical capability at all. The pilot makes descents to published lower altitudes (to clear obstacles) as the aircraft approaches the airport. The system would need to be accurate enough to meet the TERPS (standard for defining clearance from known obstacles) criteria for a non-precision approach, of which the VOR, NDB, BC Localizer, TACAN, all meet these requirements.

There are GPS systems now being sold for use in private aircraft. The GPS instrument approach is a reality, as evidenced by renaming a VOR approach to GPS and VOR. Reference: VOR and GPS Rwy 22, Bradley Int'l Airport, Windsor Locks, CT. More and more, with the latest Jeppesen revisions to airports everywhere, GPS is being included as a navigational aid for making a non-precision approach to an airport.

The technology is there, and accurate enough for this type of instrument approach to an airport. The weather minimums are high enough, with adequate clearance from surrounding objects for quite a distance, that lateral error from the system could be tolerated to some degree, probably, as much from any other non-precision approach nav-aid.

To my knowledge, no commercial airline is using GPS for point to point navigation, nor instrument approaches. This is probably more due to cost, than technical capability. Someday, I expect the GPS will replace the VOR and TACAN navigation system.

Well Bob here is a new thought...with the space vehicles passing for such short periods of time, with only a few effective passes over a given area in a 24hr period and given the short transmit cycle of most APRS stations why not include in your regular APRS a feature you included in the APRTrak program. That is, have everyone upload the current KEPS and have APRS track the space vehicles. When ever the target 145.80 station's effective area enters the area of the tracking APRS, have APRS inhibit all transmits and digi's during that short pass. Make the inhibit process include an ID and comment that this APRS station will cease transmit operation during the current satellite pass, maybe even change the stations symbol to a skull and crossbones during the pass and have any receiving APRS station not tracking the satellite inhibit for a set period of time if they decode the sysbol. Once the pass is clear your station's effective area, APRS turns back on the transmit function and all is normal untill the next pass that covers your area. I realize this will affect only those stations actually running the APRS software, but at least in my area that includes 99% of all APRS stations. I have an unattended wx node/digi, but with no one else xmit'n it will only xmit every 6 min or so and I can lengthen that. With a little creative thinking I bet some of the APRS/Packet experts can come up with a plan that would allow one APRS' inhibit (proposed) function to inhibit a networks worth of digi if they fall into the effective area of the Satellite pass. I don't think that coexistence is out of the picture if we apply a little technology and creative thinking, at least they didn't pick 145.79 as their freq. I remember when I was trying to contact the Shuttle via phone and was running APRS full time at the same station the two seldom conflicted timing wise. 73...Keep up the good work...FredQ.

Good point, and we all need to be thinking of putting new services on UHF and above. It is kind of dumb to be trying to put more and more digital modes on 2 meters were there is very little room left for anything.

We have run out of good repeater pairs here in Pinellas, and repeaters are showing up were they should not be, like there is a repeater on 145.820 here in Florida, which should make the satellite people very unhappy.

But 2 meters is not effected by the environment as much as UHF and above making it better for mobile ground communications, or for

tracking mobiles, where UHF and the microwave bands seem to be better for space comms.

But if necessary I will move as long as the new frequency does not interfere with any other users and it is more than 15 khz from any other users.

Rendered body type: text/plain

144.390 is in the middle of the "new Oscar subband", which will be used for Phase 3d. once that is launched. Our regional bandplanning group did check into the freqs antipated for phase 3d, and 144.390 did NOT conflict.

OWNYPAG (The Ontario Western NY Packet Advisory Group) adopted the proposed "Canadian" bandplan, for our region, as it is the best to meet the needs of the 90's, copmared to the existing ARRL plan that is listed in our repeater guides.. Also, as it serves all of Canada, and therefore makes for uniformity. We had a rep. from the ARRL national Vhf/Uhf group, as well as his RAC counterpart, so the plan was not made in a vacuum! Months of thought and negotiation went into it.

The plan needed revision, it was not forthcoming from national, so we tackled it. We even made room for existing AM groups on 2 meters!! (grandfathered in, as well as FM simplex in this subband, again based on the planned up/downlinks proposed).

I need hardly point out that the freqs arbitrarily picked for shuttle communication, used at the time when the ONLY freqs available for packet, 144.91 to 145.09Mhz created some problems (and still do). Fortunately there are noe other packet subbands.

It's time for ALL to sit down and try to coordinate things a bit! The growth of digital has far exceeded the demand for repeaters, manyfold. Look at the spectrum allotted for those devices.. take a listen to the activity on those, or should I say lack of activity..

73, Greg, KE2VW
Chairman, OWNYPAG (Ontario Western NY Packet Advisory Group)
Chairman, WNYSORC (Western NY Southern Ontario Repeater Council)

Adding orbital calculation code to APRS would certainly "fatten it up"! Rather than program limitations in the software, we might consider voluntary modifications to our operating habits when we have close celestial neighbors on .80.

We should all have our beacons and digi beacons set to the maximum practical interval - more than 30 minutes, at least. That significantly cuts the possibility that digi'ing of beacons will overlap a spacecraft orbit. If we

all used our satellite tracking software to keep track of those periods and minimized keyboard and tracker activity when a manned mission is using .80, we might find that peaceful coexistence is possible without any modifications.

With the amount of orbital modification that occurs with the normal shuttle flight, updated keps should probably be done every day. Most of the on-line services carry keps and keep them updated, especially when a shuttle mission is aloft. They are also available from archive.afit.af.mil in the /pub/space directory for those with Internet access.

If we hope to get wide support for APRS equipped manned missions, a cooperative posture will sure go a long way toward winning friends among the payload decision makers!!

Doug

>
Well Bob here is a new thought...with the space vehicles passing for such short periods of time, with only a few effective passes over a given area in a 24hr period and given the short transmit cycle of most APRS stations why not include in your regular APRS a feature you included in the APRTrak program. That is, have everyone upload the current KEPS and have APRS track the space vehicles. When ever the target 145.80 station's effective area enters the area of the tracking APRS, have APRS inhibit all transmits and digi's during that short pass.

...FredQ.

164. 145.80 vs 145.79 SOLVED!

On Wed, 6 Dec 1995, Fred Quarles suggested adding Spacecraft tracking to APRS (since it is already in APRtrak) and have APRS go to a MINIMIZE mode during a pass. This idea is the basis for a PERMANENT SOLUTION!

I can put a MINIMIZE function in all APRS software that is capable of being commanded to MINIMIZE non-essential APRS packets during a pass as follows:

1) One station in each APRS area will be designated as a "MINIMIZE" command station. It will have a special version of APRtrak that has the ability to transmit a MINIMIZE command on 145.79.

2) On receipt of a MINIMIZE command, all APRS stations will hold off non essential packets for about 7 minutes. Since all routine APRS beacons are transmitted at a 15 or 20 minute rate anyway, this will have an insignificant effect on ROUTINE operations.

3) When a station receives the MINIMIZE command, the SCREEN will show that MINIMIZE has been effected. ANY APRS operator can decide to OVERRIDE the MINIMIZE if he is doing something special that needs to continue to operate during those 7 minutes.

4) ALL OFFICIAL SAREX and other planned events will be given access to the special version of APRtrak that can generate the MINIMIZE command.

5) THE ULTIMATE solution is for Space Station to carry APRtrak. Even during VOICE operations, at the end of each VOICE transmission, a single 0.2 second packet burst would be transmitted that contains the standard APRS GPS POSIT! Not only will this allow EVERYONE to see where the SPACE STATION is, but it will also trigger the MINIMIZE function in those area wide MINIMIZE command stations. In effect, the SPACE user REQUESTS a MINIMIZED frequency as it moves! (and only when it needs it)

CONCLUSION: Everyone is happy, everyone stays put, the 145.77 guys are not impacted, the APRS users have control over their stations, but we have used technology to solve an un-resolvable frequency coordination problem! I will work with Keith to finalize the details....

Remember, it wont take many COMMAND stations. One station in Maryland could execute MINIMIZE via the existing network and affect APRS stations

out 250 miles via the network.

AND adding the Packet burst (with GPS posit in it) is not a burden to the SAREX or SPACE STATION, but an actual ADVANTAGE! It can serve as an alerting beacon that the SPACE STATION is in range and shows the schools where the STATION is...

Sounds good. Now that Bob told me what the "work-around" is (to pretend that the displayed figure has a 0 ahead of it and that the number is less than 1), I can deal with it. But it'd sure be nice if it displayed correctly. Go for it

What about using the BPQ switch with APRS? You can use the switch software with a Baycom modem with a special driver. I have the switch working but could not get APRS working with BPQ. Has anyone done that?

>But 2 meters is not effected by the environment as much as UHF and
>above making it better for mobile ground communications, or for
>tracking mobiles, where UHF and the microwave bands seem to be better
>for space comms.

I beg to differ....2 m is highly effected by the environment, as is evident when there is a band opening all *#\$@! breaks loose. It is this very issue that is either a problem if you are a user on a digital network, or a boom if you are a DX chaser.

2m has lower path loss, by about 6 dB or so, than 70 cm and is thus better for mobile where signals tend to be weak. Although one can achieve more antenna gain at UHF, the problems with fading on NON-error tolerant digital signals (like our ax.25 packet protocol) can be a serious problem at UHF in a mobile environment.

I would recommend that APRS stay on 2m for mobile and related uses. (I will stay out of the 145.790 freq. discussion). But, is there a need for a backbone type link between major metropolitan areas running 9k6 baud on UHF. I say yes! Its only a matter of time until the single 1200 baud channel is congested. (Gee sounds just like 2m packet was like 10 years ago, before the addition of other channels.) Is there a plan to incorporate multiple tnc's and new path names into APRS to handle the desire to show up in multiple cities without going to hf? In Chicago I would like to see the WX in Milwaukee, and St. Louis, and Greenbay and etc, but just listen to 30 m today, it's getting busy! Just a thought.

Hello All,

I have some real basic questions about APRS (also about Packet Radio). If anyone can tackle a few for me, I'd appreciate it. Here we go...

Q: Where are FAQ files for APRS and Packet Radio?

Q: How is APRS pronounced?

Q: Can someone who is not an Amateur radio operator have an APRS setup (roaming transmitter and base)?

Q: (I picked up the buzzword TNC) How dumb/intelligent are these things--what features and costs are there?

Q: What kind of collision detection is used before/during packet transmitting is used (if any) ?

Q: What is the smallest and most portable transmitter configuration (Locator/TNC/Radio) ? How long will this configuration last on a set of batteries?

Q: Are there any portable radio's with a built in TNC?

Q: What kind of base software is available? Do they run on DOS, Windows or ...??

Q: Roughly, how many roaming devices are potentially in use? How many bases

are there?

Q: What are the current limitations of APRS? i.e., maximum units being tracked, maximum distance from base (or repeaters), error rate, ...?

Q: What is APRS currently being used for? What about the future?

Q: When will every vehicle, child, and dog be tracked via APRS ? :-)

Thanks for any replies, --Lance

A friend of mine here in Daytona Beach, KD4KDR, and I have been experimenting with APRS for about 3 months now. There are now 7 of us who play APRS on 145.790 every night now in Daytona Beach. KD4KDR would like to set up a GPS and TNC in his mobile. I'm looking for suggestions from the experts as to the best, cheapest, smallest GPS TNC to use for this purpose. I am also wondering, at this initial stage, what controls the GPS/TNC position report timing. Is it programmable with a TNC parameter or is it uncontrollable.

P.S.: I am still waiting for WB4APR to include an ICBM symbol in APRS that explodes on impact so that our Daytona Beach "war games" will be more realistic...He He.

The Dallas White Rock Marathon will be held on this coming Sunday, December 10. While there is a lot of APRS interest in Dallas, we are really just getting started with it. We had hoped to use at least one APRS tracker for the marathon. However, some more equipment has become available and we'll now be running several trackers. The problem now is that we don't have good detailed maps of Dallas, and none of us has any experience making them yet.

If there is anyone out there who has access to the 2,000,000:1 data for Dallas and has the time and inclination to make a more detailed map of the Dallas area that we could use for the marathon it would be a BIG addition to our APRS experiment this weekend. I think that a 10 mile map, centered roughly at the intersection of ROSS AVE. and GREENVILLE AVE in Dallas would be just right.

I apologize for the late notice. Anything that anyone can come up with will be more than we have available now. Thanks in advance.

Randy's Great American APRS Train Trip

or

My Wife Thinks There Is Too Much Technology On This Trip.

Two weeks from today, Wed Dec 20 to Sat Dec 23, my wife and I will be on the AMTRAK train from Sacramento Ca. to Rochester NY for Christmas.

The trip basically is from:

Sacramento, Reno, Salt Lake City, Denver, Lincoln, Omaha, Chicago, Toledo, Cleveland, Buffalo, and Rochester.

I'll have along my goodie bag of toys including; PC Laptop, FT-51R & FT470 HTs, Pico Packet TNC, GPS-45 w/active ant, Scanner for rail monitoring and batteries. I'll also have along some reading material, Walkman with AM/FM radio, camcorder, clean underwear, Swiss Army knife, and a bottle of Scotch. We will have a Deluxe sleeper compartment to Chicago, then in a much smaller sleeper the last night going into Rochester. The Deluxe sleeper room has power available.

I plan on having my APRS system up and running along the trip. I need information about areas along the trip that have APRS activity and the local APRS frequency. Otherwise, I'll transmit on 145.79 MHz. I'll try and keep it running as much as I can. I don't know if I'll have room to keep the station running at night, but be on the lookout for it. The TNC has a PBBS, so leave me a message!

Please pass along your local APRS frequency. I'll be using the RELAY,WIDE,WIDE path, unless different for local areas. Point your beams at the train track!!

I'll try to also monitor the 2M FM railfan frequency of 146.49 MHz along the way.

I have found the lats and longs for each stop (Internet is great!) and will enter all that data into the GPS-45 as waypoints.

Below is the rail timetable, so that you can be on the lookout for me. I don't know how close AMTRAK keeps to schedule (if I get there on the right day that is probably doing good!). Also below is the lats and longs for the stops. If you have a better posit for the train station, please pass it along.

If anyone has any suggestions that will improve my operation, please pass them along.

Busy packing, planning, and testing,

Randy

FOLLOWING REPLYs ARE CAPATIALIZED FOR RECOGNITION.

```

> Chris Petersen, INTERNET:102261.1225@compuserve.com ASKED:

> I'd like some information regarding APRS to help me better understand the
> 145.79 issue better.

> How is APRS used?
ITS A CONNECTIONLESS DSITRIBUTED PACKET SYSTEM WHICH USES UI PACKETS
WITHOUT ACKS SO THAT EVERYONE SEES EVERYONE. THE PRIMARY FUNCTION IS THE
MAP DISPLAY WHICH SHOWS THE POSITION OF ALL STATIONS MOBILE AND FIXED,
AND ALSO ANY NUMBER OF SYMBOLS OR OBJECTS REPRESENTING ANYTHING FROM
RUNNERS, AMBULANCES, FIRETRUCKS, TORNADOS, RAIN, BOATS, SATELLITES...

> How much data is sent in a packet?
ONE LINE ONLY.  CONTAINS DATE,TIME,POSITION,AND STATUS

> Who is sending the packets?
EVERYONE WHO HAS INFO TO SEND

> Base, mobile?
BOTH, MOSTLY BASE, NOW, BUT MOBILES ARE GROWING

> What percentage of channel availability is expected to be used?
THE OPTIMUM LOADING IS EXPECTED TO BE SOMEWHAT LESS THAN CSMA 36%
* NOTE THAT NO SINGLE USER HOGS THE CHANNEL FOR ANY LENGTH
* THE MAXIMUM PACKET RATE FROM THE MOST BUSY ACTIVE STATION IS
ABOUT ONE PACKET EVERY 15 SECONDS, BUT THIS PERIOD *DOUBLES*
AFTER EVERY PACEKT, SINCE OLD NEWS IS LESS VALUABLE
SO IT WOULD NEED TO BE A BUSY SET OF FINGERS THAT COULD LOAD
THE CHANNEL MORE THAN ABOUT 10%

> Is this channel to be used for DGPS services?  If so, how many DGPS
servers do you need in a given coverage area?
YES/NO.  WE TRIED IT, IT WORKS, BUT YOU NEED TO SEND DGPS PACEKTS EVERY
30 SECONDS OR SO TO BE OF ANY VALUE, AND THIS TAKES UP 30% OF THE CHANNEL
CAPACITY!  BEST SOLUTION FOR DGPS IS TO USE A DIFFERENT CHANNEL
TRANSMITTING DGPS DATA ALMOST CONSTANTLY.  NO NEED FOR THIS ON 2 METERS!
NO NEED FOR DGPS IN APRS EITHER.  *WE DONT NEED THAT ACCURACY* FOR TYPICAL
PUBLIC SERVICE EVENTS.

> Why can't APRS share existing packet frequencies?
ONLY ONE REASON.  THE MASSES THINK *UI* MEANS *BEACON* WHICH IS A
FORBIDDEN WORD ON ALMOST *ALL* PACKET NETWORKS...  BUT AN APRS UI FRAME

```

CONVEYS NEW AND CHANGING INFORMATION AND ELIMINATES ACKS... EVERY PERMANENT PACKET SITE, BBS, NODE, WHATEVER, SHOULD SEND AN APRS POSIT/ID AT LEAST ONCE AN HOUR SO THAT EVERYONE CAN SEE THE NETWORK TOPOLOGY JUST BY MONITORING A FREQUENCY. MONITOR SUCH A NETWORK FOR AN HOUR AND YOU WILL BE AMAZED AT ALL THE DEVICES AND SERVICES ARE ON THAT FREQUENCY. APRS ID/POSIT BEACONS ARE AN *IDEAL* FREQUENCY COORDINATORS TOOL

> Does APRS need the exclusive use of a frequency and why?
*YES. THE ESTABLISHED APRS NET IS FOR TRACKING MOBILES. MOBILES TRAVEL. MOBILES CANT POSSIBLY KEEP UP WITH ALL THE PATHS AND FREQUENCIES AND LINKS OF EXSTING NETWORKS. ALSO THE GPS/TNC/RADIO TRACKING DEVICES ARE SINGLE FUNCTION BOXES. SINGLE FREQUENCY XTAL CONTROL IS THE ONLY COST EFFECTIVE MECHANISM FOR OUTFITTING MOBILES.
* ALTHOUGH APRS SHARES A CHANNEL WELL AS A SOURCE OF DATA, IT DOES NOT LIKE TO SEE THE CHANNEL HOGGED FOR CONNECTED DATA TRANSFERS THAT TIE UP THE CHANNEL FOR LONG DURATION. ANY LONG DURATION USE LIKE THAT WOULD KILL LOTS OF UI FRAMES AND DATA WOULD BE LOST...

> Why does APRS need a nation-wide frequency?
OOPS, SAME AS ABOVE.. SO MOBILES OR EMERGENCY RESPONSE TEAMS CAN MOVE FROM AREA TO AREA TRANSPARENTLY. WE CAN TRAK AN AUTO FROM MAINE TO NORTH CAROLINA (ALMOST) AND FROM GA TO MS. THE AUTO NEVER NEEDS TO STOP, TO CHANGE FREQS, OR TO LOOK UP REPEATER CALLSIGNS, HE JUST DRIVES...

> Pointers to sources of information on APRS, (Web sites, FTP sites, etc.)
> would be appreciated.

INCLUDED WITH ALL COPIES OF APRS IS A README DIRECTORY. LOOK IN THERE FOR THE FOLLOWING FILES:
APRS.DOC
OPS.TXT
UHF-FREQ.TXT
DIGIS.TXT
PROTOCOL.TXT

HOPE THIS HELPS...

176. Re: [APRSSIG:4960] Dallas Marathon

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 6 Dec 1995 16:23:57 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951206161851.13638H-100000@greatlakes>
Rendered body type: text/plain

REGARDING the marathon in Dallas. The existing map is all you are going to get from the 2,000,000 CD ROM. (more water and boundaries are possible) but no more roads. Your best bet is to send one of your trackers ourd driving with a GPS rate of once every 10 seconds, and either save a track history in his laptop, or pick him up off the air, and save the track history.

Then bring up the dallas map in MAPFIX, use the alt-G command to replay the track history and all of the posits will be plotted on the map. Use the alt-NEW and alt-ADD commands to DRAW a PURPLE (color 13) line over those track history points and you will have an EXCELLENT route map for your marathon. Sketch any other detail you can think of....

If you really want to have fun. Run APRSdr and put the lead runner on the purple line as an object, and give it a speed of 9 knots. And that object will run the marathon even without a tracker...

177. Re: [APRSSIG:4958] APRS: Newbie Question

From: JAgrelo@aol.com
Date: Wed, 6 Dec 1995 16:24:48 -0500
To: aprssig@tapr.org
Message-ID: <951206162444_126779050@mail06.mail.aol.com>
Rendered body type: text/plain

In a message dated 95-12-06 15:39:35 EST, you write:

>I have some real basic questions about APRS (also about Packet Radio). If
>anyone can tackle a few for me, I'd appreciate it. Here we go...

>Q: Where are FAQ files for APRS and Packet Radio?

Download the APRS program from aprssig@tapr.org in the upload section and

check out all of the readme files in the program itself, the program is available in Mac or DOS.

>Q: How is APRS pronounced?

A,P,R,S or (long) A'pers sounds like PAPERS or Automatic Packet Reporting System

>Q: Can someone who is not an Amateur radio operator have an APRS setup
>(roaming transmitter and base)?

Yes, but the transmitter is the main concern, are you licenesed to operate on a particular frequency?

>Q: (I picked up the buzzword TNC) How dumb/intelligent are these
>things--what features and costs are there?

TNC's (Terminal Node Controller) are intelligent enough to do the job, and are available as low as around \$129.00.

>Q: What kind of collision detection is used before/during packet
>transmitting is used (if any) ?

The AX.25 radio packet protocol has this built into and is in all TNC's.

>Q: What is the smallest and most portable transmitter configuration
>(Locator/TNC/Radio) ? How long will this configuration last on a set of
>batteries?

Well, this is a very broad banded question, but I will try. The transmitter can be as small as 1.920" x .536" and as big as a house, the preliminary questions should be, how much power is required and desired range. The TNC's are available the size of a cigarette pack. And how long will it last depends on how much power the transmitter is putting out and how often. There are no solid answers until the requirements are detemined first.

>Q: Are there any portable radio's with a built in TNC?

Some.

>Q: What kind of base software is available? Do they run on DOS, Windows or
>...??

APRS in DOS, Mac, and soon Windows.

>Q: Roughly, how many roaming devices are potentially in use? How many bases
>are there?

How many people chew gum, I don't know!

>Q: What are the current limitations of APRS? i.e., maximum units being
>tracked, maximum distance from base (or repeaters), error rate, ...?

There is no limitation to the amount of traffic except, the more there are on frequency the harder it becomes for the TNC to handle it (more possible collisions).

>Q: What is APRS currently being used for? What about the future?

Emergencies, marathons, tracking my wife, dogs, dead cats (I am allergic to them),RC planes, rockets, balloons, cars, boats, bugs (fleas, tics, ants, grasshoppers, butterflies, birds, golfballs, boogers,etc....)

>Q: When will every vehicle, child, and dog be tracked via APRS ? :-)

Everyone in the world, hmmmm.

>Thanks for any replies, --Lance

APR REPLY: And all of those voice repeaters could be used simultaneously
for full duplex long distance 9600 baud data links. 70 channels on 2
meters too. It can be done, is simple, and does NOT impact current voice
users. See my 70chnls.2m README FILE...

One way to communicate your travel planns to all APRS users is to enter all the way points into an APRS track history file. You can then post that message here as a text message, everyone can replay it, and they will see ALL your waypoints on their MAPS....

Subject: [APRSSIG:4954] Best band?

. I would recommend that APRS stay on 2m for mobile and related uses. (I will
. stay out of the 145.790 freq. discussion). But, is there a need for a
. backbone type link between major metropolitan areas running 9k6 baud on UHF.
. I say yes! Its only a matter of time until the single 1200 baud channel is
. congested. (Gee sounds just like 2m packet was like 10 years ago, before the
. addition of other channels.) Is there a plan to incorporate multiple tnc's
. and new path names into APRS to handle the desire to show up in multiple
. cities without going to hf? In Chicago I would like to see the WX in
. Milwaukee, and St. Louis, and Greenbay and etc, but just listen to 30 m
. today, it's getting busy! Just a thought.
.
.

Hear, hear!! a great idea! I've been an advocate of this idea for some time, but haven't had much luck in interesting others. Are there others around who are interested?

. Paul, WD9ABE
. Maybe closer to Great Lakes NTC than anybody.

-Will KB9JTT
New Berlin, Wisconsin
Approx. 7 miles from the Great Lakes (but farther from GLNTC)

>10.
>If there is anyone out there who has access to the 2,000,000:1 data for

I have the 2,000,000 to 1 CD-ROM and Keith Sproul is sending street level
100,000 - 1 maps for MacAPRS this week.

The 2,000,000 level maps are too crude. I can read PC aprs maps but
can not make them.

Most of the Computer APRS system will be PC based.

Looks like we need PC maps of a 3 mile radius centered on
Lat 32d 49m 30s
Lon 096d 45m 30m grid Em12ot or near Zipcode 75205.

I plan to try making a TIFF of GIF file of the supplied course map
and a PICT of the Delorma Street Atlas 2.0 then run the route with
GPS input to the APRS Mac portable and then try to align the maps.

Bill KE4EER Is good at 2 mile PC maps (how about it Bill ??)

We will report back to the sig our results.

I will be at the marathon in Dallas, helping out. I was also looking for
someone with 2,000,000:1 data for a map, but since Bob says there is no
further data- he must have made the existing one with the available data. I
don't remember the Dallas maps looking like the sample TN map or any of my
GA maps, though. Maybe it is just the water and boundaries that make it
look better.

Claude- I'll be glad to do the update to the existing map if you'll get me the gps track. Put aprs on a laptop with no tnc enabled, set the pos rast to every 10 seconds as Bob says and then drive. Send me the tk?????.hst file you save with the F S command. That's how I update a lot of maps.

Hnag loose guys just downloaded the file for Dallas from USGS biy they do everything BIG in Texas, i have never seen so many files for one city WOW. So hang in there i'm working on it but will only do the roads no water. I still don't know if you wanted a 3 Mile map form center or overall. If from center that may be to large to make in one map. Back to the unzipping and blocking.

Bill KE4EER

Whoa! That's news to me. Guess I'll have to trash my WX station, and give up any thought of DF use! ;-)

TAPR.ORG has been working fine. The problem was with a router at the San Antonio provider. It should be fixed now. We are having some problems with interactive sessions -- but this should be fixed soon with an additional 16Megs of memory.

Just remember Internet does have problems from time to time -- it is not always a system you are trying to get to. As more and more people get on -- there are becoming periods of slow access depending on where you are located on the network and where you are trying to go or get things.

Cheers - Greg

If you are going to save the "drive" as a .HST file on a laptop make SURE that APRS is saving the LOG file!! I made this mistake recently forgetting that APRS had some changes since I last used a LAPTOP/APRS mobile setup. On your Control screen you will see LOGS (or is it LOG?) in a window, make sure it is uppercase.

 > My opinion, for the little it is worth, it to leave things were they are.
 > If we move, next week someone may try to put something on 145.78!

I don't see what all the hub bub is about anyway ... we operate packet stations on 145.01, 145.03, 145.05, 145.07, and 145.09 all with the same spacing as we are discussing here ... and they manage with no interference to each other despite close proximity ... forgive me for my daftness, but perhaps someone should explain it to me one more time.

In the meantime, if we are to change frequencies (which is fine for me since I'm not crystal bound) we ought to be both cautious and quick about selection.

1. It won't be easy because many people have spent a lot of time doing what they are doing where they are doing it and people like to resist change.
2. You can't please everyone all the time. (In other words: no matter what frequency you choose there will be someone who has a "major" problem with it.)
3. If someone has to move there may be reasons why it is better for us then them. While it is always easier to point to the other fella, there are schools and people a lot less resources then we have who may be locked in to their frequency. How many of us are really locked in to that frequency anyway? A handful?
4. Perhaps another compromise can be mediated it moving is not reasonable for either party. Perhaps, for example, we could 'shut down' or minimize the net for the duration of a SAREX mission.

Just food for thought, flames are neither required nor desired.

Randy, you will find virtually all APRS activity in the Salt Lake City area on 145.15. Although we are working on a 145.79 coordination (current sig discussions notwithstanding!), all of our stations are active on .15 today. You'll see "genuine" APRSers KC7CO (-1 and -2), KB7DD, AA7AA (maybe), N7YOD, and relays from 30m if KB7DD has the GATE up (which he does most weekends). There are a number of RELAYs about, and I have a WIDE up on the south end of the Salt Lake valley. I think we had a discussion about this several weeks ago - our high altitude WIDE is still waiting for coordination, but will be dynamite

when it comes - 9000 feet in elevation and probably 75 - 100 mile coverage each way, north, south, and west.

Randy's Great American APRS Train Trip

or

My Wife Thinks There Is Too Much Technology On This Trip.

Two weeks from today, Wed Dec 20 to Sat Dec 23, my wife and I will be on the AMTRAK train from Sacramento Ca. to Rochester NY for Christmas.

The trip basically is from:

Sacramento, Reno, Salt Lake City, Denver, Lincoln, Omaha, Chicago, Toledo, Cleveland, Buffalo, and Rochester.

I'll have along my goodie bag of toys including; PC Laptop, FT-51R & FT470 HTs, Pico Packet TNC, GPS-45 w/active ant, Scanner for rail monitoring and batteries. I'll also have along some reading material, Walkman with AM/FM radio, camcorder, clean underwear, Swiss Army knife, and a bottle of Scotch. We will have a Deluxe sleeper compartment to Chicago, then in a much smaller sleeper the last night going into Rochester. The Deluxe sleeper room has power available.

I plan on having my APRS system up and running along the trip. I need information about areas along the trip that have APRS activity and the local APRS frequency. Otherwise, I'll transmit on 145.79 MHz. I'll try and keep it running as much as I can. I don't know if I'll have room to keep the station running at night, but be on the lookout for it. The TNC has a PBBS, so leave me a message!

Please pass along your local APRS frequency. I'll be using the RELAY,WIDE,WIDE path, unless different for local areas. Point your beams at the train track!!

I'll try to also monitor the 2M FM railfan frequency of 146.49 MHz along the way.

I have found the lats and longs for each stop (Internet is great!) and will enter all that data into the GPS-45 as waypoints.

Below is the rail timetable, so that you can be on the lookout for me. I don't know how close AMTRAK keeps to schedule (if I get there on the right day that is probably doing good!). Also below is the lats and longs for the stops. If you have a better posit for the train station, please pass it along.

If anyone has any suggestions that will improve my operation, please pass them along.

Busy packing, planning, and testing,

Randy

>thank you all 73 Scott
>
>

When using a pico with the second serial port the is a TNC command that has
to be used, its ELO on.
ELO on caused the GPS data to stream onto the serial port 1 of the TNC which
is connected to your computer running APRS. This eliminates the need for the
hardware single port cable, and is quite effective.

Pertinet commands

LOC EVERY 3 number*10 seconds

GPSTEXT \$GPRMC Your \$GP??? NMEA Data type

ELO Echo's GPS NMEA data to serial

port 1 from 2

For a standalone tracker you would also do GPS on

Hope that helps
barrettd

195. Dallas Maps

From: ke4eer@ro.com (William Nolle)
Date: Thu, 07 Dec 1995 00:45:28
To: aprssig@tapr.org
Message-ID: <199512070752.BAA24409@sh1.ro.com>
Rendered body type: text/plain

I just uploaded the Dallas Marathon maps. They total 26 maps in all to cover that area (I HOPE). I did not include any waterways or streams since that area is so populated that i had a hard time making .75 Mile center maps. I had attempted several 1 mile maps but the software choked on them. It also includes a special maplist called MAPLIST.MAR to cover just that area!. The grid is 5 maps vertical and 6 maps horizontal, so i hope that enough to cover the area you guys need. If not i maybe able to add a row if needed. Gosh that's a BIG city, i had to download 34 Meg unzipped from USGS. They are on Tapr in the upload directory since it looks like we are not allowed to upload into the PCMaps directory (At least i couldn't).

To: aprssig@tapr.org
Message-ID: <199512070820.CAA25105@sh1.ro.com>
Rendered body type: text/plain

Bob would it be to much to ask if there's a way to let the F3 key go smaller then the 1 mile range. When doing the maps for that Dallas marathon and wanting to zoom in and show the map borders (Specially the + centers they don't show untill way to late. That works great as long as the maps are 1 mile or more. Now with all the detailed maps that should be addressed i think.

Rendered body type: text/plain

Greg, I tend to agree with your thoughts on Mail Bumps. Seems that the only time I get dropped is AFTER I send a message to the APRSSIG. If I stay quiet I do not get bumped but if I make a few postings I get dropped.

Thanks for working of the problem!

Though I've not used APRS, based on discussions from this SIG, it seems that the user has the arduous task of keeping the digi list updated so as

to achieve best coverage; however, if one is willing to accept whatever coverage RELAY,WIDE,WIDE gives, then it is fairly simple.

Hopefully my GPS-45 will arrive on Friday and I will be able to explore the above and learn more based on personal experience rather than by indirect observation.

Just to re-inforce the issue 144.390 is being used in Eastern Canada with a large number of digi's.

(Not to get on the weak signal people's back, as I do also work weak signal), I find that my packet radio stuff outsells the SSB stuff by 100:1 ratio (I work in a Amateur Radio Store).

Although there is a finite amount of bandwidth available, when push comes to shove, the band will expand to support those using it.

So far the 144.390 frequency has been used with little or no problems.

just my 2 cents worth....

cheers...mike

p.s. I can't believe the whining that goes on about spending \$24 on a set of crystals. A change in frequency for a digi is almost no effort, other than changing the crystals. You don't have to retune duplexors or even realign the radio. That's not even the cost of a case of beer here in Canada! (that's 24 bottles)

> >realistic...He He.

This was ACTUALLY done in the Macintosh version.. I had been asked to do a demo for a Military research company, so I put in Tank symbols, Jeep, Helicopter, and one or two others, and had the ability to 'nuke' one..

It produced a very nice explosion on the screen, including the sound-effects. Then deleted the station..

>
> That brings up a question.. Are they now, or will it be possible in the
> future to
> customize the symbols used in APRS? It might be useful for special events
> or just horsing around. (what's that I see, a miniature sleigh leaving the
> North Pole
> on a DR path to my QTH??.. grin)

This type of 'fancy' capabilities will be more realistic on the Mac/Winodze versions.. The problem is that sending the stuff to transmit the new ICON over the air takes a reasonable amount of data... On VHF that wouldn't be a problem, but if you are transmitting the sleigh from the North Pole, it would probably want to go via HF also...

Bob and I discussed some stuff sort-of similar, for use with the SSIDs for special events, i.e. the ability to dynamically assign which -# is what type of ICON... This is actually implemented in the Mac/Winodze version, but has NEVER been publicized, and as far as I know never used...

To be able to transmit a NEW icon over the air would require the transmission of 256 characters (would NOT have to be all in one packet).. This would be a 16x16 color ICON..

Then, this NEW icon would be a valid symbol UNTIL you quit out of the program.

The big problem is that most (All?) of the first 96 characters are assigned already...

We DO have a method for using an alternative 96 characters/Icon types and this is implemented, but currently, it is not being used yet..

If there is anybody that REALLY would like this dynamic ICON capability please send PRIVATE mail to me, we will discuss it, and then if it seems reasonable, we may implement it later.. (Not for several months, thought too much else going on)

I already have a very simple format designed for this if we really want to do it.. I would just have to implement it..

Keith

-- [From: * EMC.Ver #2.5.02] --

Can I suggest (again!) that, with a decent antenna, we don't need high power to get where we need to be seen on APRS?

And with reduced power, our chance of interference with our neighboring frequencies/services are also reduced? Especially if we get our radio's/tnc's outputs nominal.

And use of a bandpass filter makes it easier to hear other stations, so they don't need to run high power.

The dilemma posed by the "whatdoya think about moving frequency?" question could possibly be solved if we cleaned up our act a little.

WOW - Less than 12 hour turnaround on request for a map for the Dallas Marathon, and Bill has posted 26 maps to tapr. THANKS - Bill, I owe you one (or I owe you many!!) As soon as I get dug out from the morning's avalanche of mail and To-Dos I'll go get them. BTW, I got my tracker working last night (GPS-45, KPC-3, Kenwood 7950) so it looks like we are all set for the race. Bill, Thanks again!

203. Train Trip History File

From: randyh@gvgadg.gvg.TEK.COM (Randy Hall)
Date: Thu, 07 Dec 1995 09:09:02 -0800
To: aprssig@tapr.org
Message-ID: <9512071708.AA01376@gvgadg.gvg.tek.com>
Rendered body type: text/plain

Hi,

I took Bob's suggestion and developed a history file of my up coming train trip.

I took the zipcode history file and change the calls to cities and also changed the lats and longs. I'm not sure if that was the correct way to generate the file, but it seems to work.

This was a good exercise, in that some of the cites that are the next stop were showing up much to the West, by a couple of cities. So, I used a map for some of the data.

So, cut out the below and save it as RAILTRIP.HST and load it into APRS.
Also an interesting thing to do is to put the railtrip and the zipcode list
into one file together and load that!

Randy

204. 100K maps

From: ke4eer@ro.com (William Nolle)
Date: Thu, 07 Dec 1995 11:59:44
To: aprssig@tapr.org
Message-ID: <199512071906.NAA10741@sh1.ro.com>
Rendered body type: text/plain

Here is another couple of mapmaking tidbits to think of. When testing between the two program (MKMAPHK1 & MKMAPKKE) i have found that for some reason the original MKMAPHK1 will allow a one mile map where MKMAPKKE will not!. Now before jumping on me this test was using the same data files, same size,same everything. Today i had an occasion where i needed a 1 mile +1 map i couldn't make it at all using MKMAPKKE.... I also found the following Bug, DON'T SCRUNC if you don't have to. I was wondering why i was getting so many streets with 45 degree points, so i did two maps 1 with scrunching at bot 1.1 and 1.2 and that map had many 45 degree streets that where not there in the unscrunched map, so when making a 1 mile map and when done the map looks like a mess, just rename the MAP.DAT to your map name and if under 3000 point's leave it alone or it WILL get screwed up. Hope this helps the mapmakers a little.

Rendered body type: text/plain

Now have ver 7.4c with my PK-900. I see that a new option has appeared when setting up asking if I have a dual port to which I answered yes. Now in the status bar if I had selected from the ON-SCREEN,CONTROL,BANDS, 2PORT there appear's a "2*VHF" of "2*HF". How does one switch bands? Do you goto command mode and set it or can you do it from the APRS prog itself? With ver 74c I cant seem to alter the initaea.tnc file at all. If I change a param the entire sequence wont load into the tnc. It seems from earlier they would at least flash on the screen that they were going into the TNC, but if I went to the command mode, none of them were set. Even if I do a ALT-S none of initaea.tnc parms goto the tnc. What am I doing wrong? If I goto command mode I can enter them in with no problem but there is quite a few params I want set and this sure takes time.

Not true. I would have to tune a cavity filter on my digi. Got to have one or the imod kills it. Ok so it takes only five minutes to tune it. Now reprogramming the eprom is the most work for me. I have to dismantle the digi and take the radio to our local sheriff department. But I'm not complaining. Ill move if we have to.

This isn't a flame- just an attempt to properly enlighten users about the complexity of remotely located digipeaters at shared commercial (read: "good") sites.

Somebody wrote:

>
>p.s. I can't believe the whining that goes on about spending \$24 on a set of

>(that's 24 bottles)
>

Excuse me, I have tried to stay quiet on the subject of this frequency change.
And I'm not discussing the idea of the frequency change, either- only the suggestion that it is almost no effort to change something about a digipeater. But now I can't stand it any more, especially when someone says things that potentially can give folks the wrong idea.

Most of the time, owners attempt to place Repeaters, links, and even packet (APRS) digipeaters at the highest site possible. Something about this seems to make them cover further and for some reason users like that. Especially mobile users. Since there are not that many Hams who can develop a high site out of their own pocket change, we must rely on space provided by Commercial sites. Any time a transmitter is installed, especially at any commercial site or site shared with others, good practice dictates that at least a bandpass cavity be used.

This is to protect other users from possible spurious emissions, to protect against other signals from getting to your transmitter to mix and be retransmitted, and last but not least: to protect your receiver from desense as a result of other transmitters nearby. Tuned cavities need to be tuned (and retuned when their operating frequency is changed)

If a site owner does not require this on *all* transmitters at his site, he is doing all of his users a disservice. Many times, an RF isolator is specified and is a great idea as well!

Sure the crystals are not a major expense, even for properly aged ones that will stay on or near the correct frequency.

But in the case of a well-located digi, or someone with several digis, the other costs can mount up!

For example, in our area (Georgia/Alabama/TN) we have a nice APRS network of at least 11 digis that I can count off the top of my head.

Several are at fairly easy locations to service. Some are not. The new one we just added this weekend is over 120 miles from my house, at the top of a very curvy and dangerous 8 mile long road up a 4800 foot hill. It is not even possible to visit it in the winter due to road conditions (no snowmobiles here in GA, yet) To drive there and turn around and drive back is 7-8 hours for me.

I prefer crystal control for fixed site radios, too many things to go wrong on a synthesized unit, and an Azden/Alinco/Kenwood/Yaesu or any other ham rig has no place at a hostile site. Crystal controlled radios usually work better when they are tuned to the operating frequency. That's why alignment instructions are published in the service manuals.

I guess you could run up, change the crystals and hope the radio operated correctly on the new frequency and hope that the duplexer was tuned close enough to do its job and not damage your transmitter with high reflected power. I've even netted crystals 5 KHz in an emergency, but this has already been discussed. I wouldn't do it. I'd just as soon connect to it and turn off digipeat, before I jury-rigged something like that. (and

thanks to the remote sysop commands on the TNC, I can do that)

Luckily, I have an IFR (service monitor). I'm not in the 2-way business but do have 12 voice repeaters, 1 ATV repeater, and 3 digipeaters. I ran across a good deal at an IRS sale. I have to *borrow* or *rent* a spectrum analyzer to properly tune the cavities.

So... let's go change the frequency of N4NEQ-3

All prices in US \$\$\$\$\$\$

```
$ 75.00    Drive from Atlanta GA to Andrews, NC and back: 125 miles x 2
ways x .30 per mile
$450.00    Cost of my lost time to drive both ways and spend an hour at the
site (@ 50.00/hr)
$ 20.00    Cost of crystals from Bomar, 3 wk slow boat delivery.
$ ??????   Kissing up to guy with spectrum analyzer so we can get the cavity
"dead-on".
$ 12.00     2 meals
$ 3.00      Refreshments      (Always Coca-Cola)
-----
$560.00     For 1 Digi  !!!!
```

vs

```
$ 20.00     1 case of imported, canadian beer
```

I didn't even enter anything for the potential family problems that this little jaunt will create.

Come on down to the frequency changing party, You drive up, change the frequency, realign the radio and retune the cavity, and I'll buy the beer and have it waiting for you when you get back..

The other digis may not be as much trouble, but each one will have its own unique situation.
Some folks may have to have a radio shop retune their radio- they may not have an IFR and they will certainly want to operate within specs.

Folks- changing things about remotely located radio equipment is never easy OR cheap.

Right, Mr. Bob APR (how far was it again to that Wide-Relay you have? 3 hours each way or so?)

I've had good luck renaming the "temp" file as the map file too, except on really large detailed maps.

Some work has been done with CAT-II and CAT-IIIa ILS using GPS with
differential correction and pseudolite PRNs in Denver. Stanford is doing a
lot of the work.

> To my knowledge, no commercial airline is using GPS for point to
> point navigation, nor instrument approaches. This is probably more due to
> cost, than technical capability. Someday, I expect the GPS will replace
> the VOR and TACAN navigation system.

It may be ended now, but Alaska Air, and Continental were doing GPS
approaches at several major airports, and Continental Express was routinely
using it at Denver as an experiment.

Once the FAA WAAS is in place real time updates with high precision
positioning will start to become routine. I do *NOT* expect the \$300 GPS
receivers, however, to ever be in this game. I fully expect the receivers
used for this will be code-correlated L1/L2 receivers with carrier phase (for
the technically inclined).

I'm hoping to start a project using APRS and airborne GPS in the Flying Club
airplanes here as a poor-man's radar for the local tower... as a demonstration
only. Just playing with the idea, though, rather than looking at it as a
"real" venture. (no local radar feed, and we're below the horizon for ZHOU's
nearest site)

I guess you're not completely conversant with doppler shift, which markedly increases w/ frequency increases. Microwave is used to geostationary satellites (TDRSS) because they do not move much relative to the earth, and therefore the doppler shift is limited. The Shuttle, Mir, and SS Alpha will move at 17,000 MHP, for a round number, in relation to Earth's surface. That makes for reasonably high numbers.

> are no other packet subbands.
```

Actually, we did not arbitrarily pick the frequencies originally. When they were selected, packet did not exist. When STS-35 flew SAREX-II, post-Challenger, we had some apprehension about using those channels, BUT, since they were not yet assigned/coordinated to packet in most areas, and, because of the infrequent and transient nature of Shuttle passes, we decided to not go thru the gymnastics of getting frequencies changed at that point. Matter of fact, by the time it became a real issue, there was no way we could have changed frequencies before STS-35. After STS-37, some significant, if somewhat misguided, work went into changing a number of the channels. Long discussion occurred about the uplink channels. Since the vast majority of the interference was TO SAREX, we decided to leave the uplinks well enough alone. And, for the record, 144.95 was selected because it's 600 khz down, allowing folks with older radios, still a reality in 1986, the opportunity to talk to 'em. Time permitting...

- > It's time for ALL to sit down and try to coordinate things a bit! The

Depends on where you are, regards activity (or perceived activity). And you're completely correct. It's time to get the groups together. A group representing the US's coordinators has been holding regular discussions already, and are well aware of this issue.

It cannot be simply done, and it does impact voice operations. And packet operations.

A number of the voice repeaters out there are not true-FM. While this may seem insignificant, it is pretty important to those of us who've experimented with 9600 baud packet. Further, trying to move digital signals through a system where others are involved, say, at a busy repeater site, may lose you friends and influence enemies. If the radio's not tuned properly, and your digital signal starts generating hash, you could bring a number of systems, non-hams at that, to a screeching halt.

Further, the users of voice systems will note the hissing and scratching associated with 9600 baud packet as a problem and will militate for "someone" to go fix it.

Finally, you have to find an area where the local repeater guru is A) knowledgeable in how the radio really works, B) knowledgeable in how packet works, C) knowledgeable in how 9600 baud modems work, D) a packet operator himself, and E) interested in melding the two technologies. Most, but admittedly not all, of the repeater gurus I know (that I'll readily admit know how to work on radios without a guide dog) are analog types with little interest in packet at any speed. A couple of them are rabid anti-packet folk. Two are interested in analog repeaters and digital boxes. None are interested in both on one system.

If you're making maps at that level, you should not scrunch 'em or you *will* lose detail, which, after all, is the point of having the maps AT that level.

I just made a number of maps for a demo here at the 2.2 mile scale and did not do a scrunch. Further, I had to abandon MKMAPHK* because it automatically tries to do some minimization I couldn't live with!

Very well put. It's not a simple matter to change frequencies on mountaintop sites. The last antenna install for the Arizona Repeater Association was a nightmare from start to finish, including the crane ROLLING OVER on it's trip down a fog shrouded Mt. Ord road!

A "simple" lightning arrestor install on a White Tanks node took about 4 hours, including drive time. And that's an urban (more or less) site, here in Phoenix.

Anybody considered the 220MHz band for APRS. 223.58MHz comes to mind. Almost no activity in this area on 220. It would seem that the MFJ data radio would be relatively easy to modify the design to work at 220. I could be wrong and there may be other issues that I have not considered. I know that the lack of commercial radios in this band makes it somewhat unpopular for some people's use. Also for some digi owners (like me) new radios would be required along with other equipment. While I am not necessarily advocating this I think it is worth thinking about and possibly discussing.

> It cannot be simply done, and it does impact voice operations. And packet
> operations.

APR REPLY: I agree that it can't be done because of emotional and narrowmindedness, but if you say that it impacts voice users, then I'm not sure you read the article. The impact is 0.1 (one tenth) of a second delay in a voice user's access... In practice, probably 1 second... And if that is done when the repeater has been inactive, then there is no impact. A voice user can KEY up and get the repeater in 1 second... ANYTIME..

Most KERCHUNK filters are at least that long..

There is IMPACT on data users. This will ONLY work for BULK long distance transmission of machine-to-machine traffic. Since VOICE will always have priority, the data may be delayed for minutes or HOURS, But when it goes, it GOES! All VOICE users will NEVER hear the data or the HISS, unless they tune to the INPUT of the repeater...

Huh? A repeater operating on 145.820 is ILLEGAL! Quoting FCC Rules, Part 97.205:

(b) A repeater may receive and retransmit only on the 10 m and shorter wavelength bands except the 28.0-29.5 MHz, 50.0-51.0 MHz, 144.0-144.5 MHz, 145.5-146.0 MHz, 431.0-433.0 MHz and 435.0-438.0 MHz segments."

I'm not an attorney, but I can read the rulebook.

The only difference between MKMAPHK1 and MKMAPKKE, other than the menu with additional features, is that it pickup streams automatically at 2 miles and below. That could account for the difference. Suppose streams should always be a menu choice, too. Probably should keep both programs around for now.

Just writing in regards to a software which was used in conjunction with the APRS network that allowed people to connect to get data like high wind speed and such, it was shareware and I wrote the author on packet but no response, I was looking for the latest version I was interested in getting the latest copy but does anyone know how to or who created this software? It was a blue screen type deal, sent data on a regular basis in APRS format?

Also if Ed Rogers, N9LCI reads this message, could you drop me a line, I am trying to reach you.

Ron

Hi Terry, Name here is Jay, located in Raleigh, NC. What airline do you work for, if any?? I'm a aircraft mechanic for USAir here in Raleigh and I heard a rumor that USAir had a STC to install GPS in our DC-9 series. Mind you, this is only a rumor and I heard it about a year ago so I don't know the status as of now. I keep forgetting to call our avionics dept to check on it. If you hear of anything, let me know.

Might as well throw my comments in on this ongoing debate! Which is more logical? Have thousands of hams all over the world QSY, buying new crystals, retuning cavities, etc.. OR having the Shuttle QSY 5Khz. I just ordered a new MFJ xtal rig for 145.790 and have no intention on buying more rocks for it. Also, moving to 145.785 is out of the question in Southern California as a rather cranky Simplex group operates on that freq and they are already outraged about the packet QRM up 5 Khz. So, I say LET THE SHUTTLE QSY and we APRS'rs will STAY ON 145.790!!!!!!

238. Windows 95 (the great beast) and APRS 7.4 Lock-Up

The cool solution will become rather hot when any lid with an axe to grind finds that he can shut down the net. I'd suggest more thinking on this one before incorporating remote turn-off features in the software.

What are the settings to prevent radio connections to a KPC-3 GPS tracker. ??

The SYSOP remote is protected by a password
but what about the mycall and mycall-1 BBS connections.

If a connection is done to the mycall then raw GPS NMEA data is leaked over the air waves once a sec.

I Think I saw something here and I searched all 5026 APRS SIG messages but I could not find an answer.

Thanks

73.

> ON 145.790!!!!!!

I'll assume that you missed my missive on just what it takes to "LET THE SHUTTLE QSY" and recap.

1. A series of international agreements, albeit informal.
2. A series of NASA agreements, significantly more formal.
3. A new set of EPROMS for the SAREX talkies.
4. A new set of testing for the SAREX radios for EMI/EMC.
5. Verification of the actual frequencies programmed into each ROM on the bench.
6. Rewriting a bunch of technical documentation for NASA.
7. Rewriting a section in the Crew Procedures for the frequency list.
8. Changing the Console handbook.

It's probably missing a few items... I participated in a lot of these activities. the LAST time we moved SAREX to accommodate folks. The work to add 145.80 to the Shuttle downlink list has taken several years to achieve. The selection of 145.79 was not made as a considered selection in conjunction with a spectrum management or frequency coordination group.

NOW. Let me say something else. THERE SHOULD BE NO PROBLEM. This assumes you will get with someone with real test gear and set your MFJ radio up properly with your TNC. That means a maximum deviation of about 3 khz, which will work. Then, there should be little or no interaction between the two services. AMSAT has already noted some areas where attempting to listen to the AO-13 telemetry beacon on 145.809 was difficult or impossible due to 1200 baud packet activity on 145.79. This suggests that there are folks out there with significantly wider transmissions than either needed, or dictated by good engineering practice.

Just a reminder that the Geminids Packet Meteor Scatter Test is scheduled for December 14, 0000-2400 UTC (see December QST, page 100 for details).

The first test during the August Perseids meteor shower was very interesting with only a limited number of participants. I expect that the December test will be better because the advanced publicity in QST should attract more participants.

Happy trails to you,

Stan, WA1LOU

MAPS100K.txt FINAL NOTES ON BUILDING 100K MAPS

The problem is that the 1 mile maps are not even viewable unless you zoom to the 1 mile range and happen to hit the exact center of the map. You have a better chance of getting a map to come up at the .5 mile scale, but only if you are still reasonably near the center of one of these maps. If you are on the border between any two maps, you will NEVER see the maps, because APRS cannot find in the maplist, a map which can completely contain your screen. This is very frustrating to users to have the detail more or less done, but to not be able to access it in a seamless maner. This file describes what I do next to build a seamless map system. There are sort of two approaches, but a mix of the two is probably the best.

BRUTE FORCE: This method takes the existing grid of adjacent 1 mile maps and creates a completely new grid of 1 mile maps whose centers are at the CORNERS of the original grid of maps. The process uses MAPFIX and the alt-IMPORT command to import streets from adjacent maps into each of these new maps. This covers the corners of the original grid, but you still have no overlap at the top and bottom centers of the original grids. This requires yet another grid offset by 1/2 mile up and down. (There is plenty of left/right overlap built into the original maps due to the horizontal aspect ratio used by MKMAPHK.) This process will result in tripling the original number of maps...

In the center of a city or town, this will rarely work because of the density of detail. But you may be able to still join at least two adjacent maps. Although the resulting 2 mile map will have lots of blank space at the edges, this central map may be listed first in the MAPLIST, so that other laps will cover those areas when the user ZOOMS. Whenever you use a map with large blank areas, always be sure that the maps that fill in those areas are listed LATER in the maplist.

temporarily overlay each of the 1 mile maps to look for any gray level main thoroughfares that need to be drawn into the bigger maps. Look for winding roads or long straight ones that locals will recognize. Use the alt-NEW and alt-ADD commands to rapidly draw in these streets. Do not worry about getting EVERY point, just a good approximation of these thoroughfares, since this larger map will only be visible at the larger scale. The exact detail will appear as the user zooms in. Only a few of these thoroughfares are needed to give the user the visual structure of sub-divisions and known landmarks.

All of these methods use either the IMPORT or the OVERLAY feature of MAPFIX. Actually these two commands are really the same routine. The IMPORT brings points INTO the current map under construction, whereas the OVERLAY only draws them on the existing screen so you can SEE the points temporarily. This is so you can add more features to your working map by drawing over selected features in the OVERLAYED map (without having to IMPORT them ALL). Once you have given the file name for either command, you can re-use the same map over and over again with a single keystroke. This is particularly valuable with the Overlay command. To control the points that you want to IMPORT, the WHITE box representing the map CENTER and RANGE is a very powerful tool. The IMPORT function will ONLY import points that will fit INSIDE the white BOX where ever it is. You may move the box edges around anywhere you want with the alt-CENTER and alt-RANGE command.

When building a combined map by IMPORTING adjacent horizontal maps, there will usually be significant horizontal overlap. To avoid the waste of this duplication here is the process I use.

- 1) Load the first map
- 2) ^OVERLAY the next map to see where it is going to fall
- 3) Use alt-C and alt-R to move the white box so that one of its edges makes a clean line just inside the existing map edge
- 4) Now hit alt-IMPORT and the second map comes in just up to the white line with minimal overlap. Now there will only be a few streets that duplicate and they can be removed using the FIND and DELETE commands.

SUMMARY: Once you have finished generating your original 100k map grid, and can see the general density of the streets throughout the city or town, you can use the above techniques to build your maps into a seamless system of maps that in most cases is transparent to the user. This probably takes as long or longer than the original MKMAPHK process, but it is ESSENTIAL for user satisfaction. As an example, I took the 12 maps generated by KE4EER for Hattiesburg and was able to combine them into only 4 maps. A northern and southern 4 mile map, and two middle east and middle west 2 mile maps. This combined with the major street thoroughfares that I overlayed into his original 8 mile map makes a pretty good seamless map system.

I made a map showing only Alabama County's for heavy weather usage. The problem i ran into i found rather strange. All county's 64 are labeled in upper case letters, i now wanted to add the county seat city in Lowercase letters. Everything worked great till the next time i loaded the map in Mapfix17 when i noticed that ALL the city names in lower case had all moved to the exact same coordinates as the uppercase county names. In other words they now are all on top of each other. At first i thought this was due to the 99 label limit but it was raised to 199, so that's not the problem. (At least i think so). Any ideas on this Bob....

Just wanted to throw this on the sig and see who else is having this problem. A few sig members seem to be having a temporary file attached to all of their postings so some strange reason or another. Whenever I try to read the message I get a fatal error and crash my system, now I try to delete any message that has a file attachment without reading it and it still crashes!

If anyone is aware of their system attaching files to messages please try to correct it, I myself cannot just delete the messsage or read it no matter what I do it crashes the system. If you see someone with this problem please advise them, they themselves may not see the attachment and may not be aware of the problem it creates.

Could this be some sort of "virus" seems harmless enough but annoying? Some virus freak could think of it as funny and what a "wonderful" way to annoy someone. Let one person in internet catch it and let everyone that reads their mail need to deal with it!

Geminids Packet Meteor Scatter Test

Date: December 14, 1995
Time: 0000-2400 UTC
Freq: 50.62 MHz, 145.79 MHz (if available in your area)
Mode: 1200 baud AX.25 packet

Sending Packets

According to the plan, each quadrant of the continent will take turns transmitting for 15-second periods of each minute as follows:

Northeast stations transmit for the first 15-second period of the minute (seconds 0 to 14), Southeast stations transmit for the second 15-second period of each minute (seconds 15 to 29), Southwest stations transmit for the third 15-second period of the minute (seconds 30 to 44), and Northwest stations transmit for the fourth 15-second period of each minute (seconds 45 to 60).

There are two ways to transmit your meteor scatter packets. Use the meteor scatter mode of APRS. This mode allows your computer to automatically send packets and plot received packets on a map.

The second way is to insert your grid square in the T0: address field of your TNC by using the UNPROTO command and then use the Converse Mode to send packets.

If you live in any area that straddles a quadrant, you must plan carefully and coordinate your transmissions with other local participants. Make plans not only to minimize interference to other locals, but to be sure that you are transmitting at a time when your intended target is scheduled to listen.

By the way, only stations running at least 100 watts into a beam antenna should transmit. Anything less is unlikely to propagate packets via meteor scatter and just causes unnecessary QRM.

Receiving Packets

Even if your station is not a powerhouse, you can still participate by monitoring the test. If you are running APRS, each received grid square packet is plotted on a map and entered into the APRS Heard log. If you are not running APRS, I recommend setting the clock in your TNC and enabling the time-stamping function so that each monitored packet displays the date and time of its reception. This makes logging received packets easy and permits unattended monitoring and logging when you are unable to sit in front of your computer.

During the reception period, watch for stations sending packets containing grid squares. If you have a grid square map handy, make a note of the grid squares that are 500 to 1200 miles from your QTH and when you receive a grid square from one of those, you know you have hit pay dirt. If you are running 100 watts or more into a beam antenna, you can try and make a connection with that station, too!

Reporting Packets

After the test, send your reports contain the following information:

Your call sign
Your state/province
Your grid square
Your effective radiated power (if you transmitted during the test)
Call sign of received/connected station
Grid square of received/connected station

THANK YOU!!! I thot I was the only one with this problem. Here's what I just got:

-----  
I set CMS PBBS to force anyone who connects to MYCALL to end up in the PBBS where I have info about my setup and APRS in general. It also circumvents the problem you mentioned.

-----

Subject: [APRSSIG:5028] GPS KPC-3 TRACKER connect

What are the settings to prevent radio connections to a KPC-3 GPS tracker. ??

The SYSOP remote is protected by a password  
but what about the mycall and mycall-1 BBS connections.

If a connection is done to the mycall then raw GPS NMEA data is leaked  
over the air waves once a sec.

The Jefferson County Amateur Radio Club, KC7KEZ, will be on the air from  
Port Townsend, WA demonstrating HF APRS on 10151.5MHz for its annual  
Christmas party, Sunday Dec. 10.

This will be the first introduction to APRS for most club members except  
for W7LD and KI7QX who have tried HF APRS on and off for the past  
several weeks. I (KJ7ET) was on HF APRS for several weeks three weeks  
ago until I had to return my borrowed HF TNC. At the time I received  
several reports that there had been not much HF APRS activity from the  
Pacific Northwest.

So look for us and let us know if you see (hear?) us.

I read the Test Announcement posted by Stan and it states that the South  
East transmits for the second 15 seconds of the minute. I just did a test by  
setting up a special APRS for just that and after entering all the info and  
picking SE for the TX sector it transmits the first 15 seconds of the minute.  
Maybe i'm getting older then i think i am and loosing it somewhere Hi.

Hello Bill,

I believe that 96 degrees west is the dividing line between east and west for  
aprs meteor scatter purposes, so depending on which side of that dividing line  
you find yourself in the Lone Star State, you can be in the SE or SW.

73,

Stan, WA1LOU

261. RE: APRSSIG:5034 Final 100K steps

From: ke4eer@ro.com (William Nolle)
Date: Sun, 10 Dec 1995 08:21:01
To: aprssig@tapr.org
Message-ID: <199512101528.JAA28477@sh1.ro.com>
Rendered body type: text/plain

I read Bob's Final 100K steps and i don't mind telling you the instructions sounded complicated to me anyway. I read them over and over and attempted to duplicate what Bob did, and i'm sure that most people can understand what it's all about, but i couldn't (Getting old) and things are getting harder and harder to grasp (Boy am i leaving myself wide open for the flame throwers) hi. But what i did do is played around with those maps i did for Hattiesburg,MS and found that if i increased the range setting in the Maplist.ms to 2.1 rather than the 1.1 that when i move the cursor from one map to the next that i am always on a map and never hit a spot that doesn't have one. I moved the cursor like a mobile user would and at the point where one map ends you will find yourself already on the next map due to the horizontal overlap of the maps. Now this doesn't work as good when moving the cursor from North to South, this of course is due to there not being any overlap but i found it still exceptable because you still move from one map into the next without ever being in a blank space. I have not seen Bob's setup yet but doing it this way will not add any additional work. I'm still going to do some more testing with different combonations tough to try to improve the 1 mile map systems. As for finding the map centers i never have to much of a problem with that since when i make a map system for a City or Town i start with a main map in the 8-10 mile range depending on the town size of course, then when my gridwork is drawn i also draw a box around the parameter of the gridwork using the color 7 (L/Gray) so when i zoom in on the town my gray box comes up first showing me where all the 1 mile maps are located. If you have any of the Huntsville,AL maps you can see how that works. I hope this will all help some of you out there that are just getting into making street level maps for your area. And i'm sure there are many many ways to do this other then the way i do it. I have made something like 450 maps now and am still leaning new tricks and shortcuts. So if you find a better way let all of us in on it.

APRS began on .79 because it was designated an experimental frequency for new modes and applications in the area. Seemed like the perfect place to experiment.

But the problem with potential interference with the future manned space frequency opf 145.80 has BEEN SOLVED. The next version of APRS and all future versions will have embedded the ability for a properly designated net control operator to command MINIMIZE. This causes all UN-ATTENDED APRS stations to hold off automatic packets for 9 minutes. ATTENDED atations are also minimized, but the operator may override if he is in the middle of emergency or priority traffic. Once the SPACESTATIONS or SAREX begin using APRtrak for transmitting their GPS position in a 0.2 second burst (even on voice passes) then this MINIMIZE function can be automatic. This will result in MINIMIZE being commanded ONLY when the MANNED SPACE frequency is actually in use by the astronauts.

Message-ID: <199512101542.KAA21339@moose.erie.net>
Rendered body type: text/plain

Bob or someone who has hooked up the new U-2000 weather computer:

Tom, N3HPR, just got his new U-2000. He also has APRS version 74c installed; he is registered for weather; and has done an Alt-S to validate. But the weather is not being received by APRS--nonsensical info and improper numbers and letters are displayed at top of screen

The WX.TXT file is a little vague.

Which mode on the U-2000 is to be used to supply data to APRS?

Is a different cable required between U-2000 and computer--he is trying to use the cable that came with the U-II?

What baud rate should be used--he is using 4800?

Help, please. TNX

I have seen the same attachments on other sigs. Rumor has it that they are caused by Microsoft's Internet Mailer that is included with Win 95. Supposedly it defaults to attaching a write doc to the file. If you using Win95 please check your settings.

An alert appeared on CIS a few weeks ago warning users to be careful of attachments to unsolicited email messages. It seems that, in some cases, a virus is passed.

It was advised that if the email is from an unknown party then do not read the attachment.

MacAPRS will run on a Mac SE IF, it has 4meg of memory and is running System 7.0 or later..

You DO have to have a hard drive for all of this..

The Mac SE has 4 SIMM slots, and they can only use (30-pin) 256K or 1M memory SIMMs. (The best you can have is a 4M Mac SE.)

Because of the processor, I have not been able to get the 2.x versions of MacAPRS running on my SE. However, 1.5.5 runs fine, with one caveat... you need to occasionally clear all the heard stations and messages, or you'll run out of RAM. (I'm using system 7.0.1, with 1.5M for the system, and 2.5M for MacAPRS. I don't load the zipcode, dx, or airport databases.)

I only have a 20MB hard disk....but I don't think you'll be able to do this with just one or two flopy drives. My advice? Get a hard disk. You can even use an external disk, so you won't have to do any 'surgery' if you have 4M of RAM. :-)

regards,

David N6UOW

WOAH! I don't *think* you're accusing me of trying to pass viruses, William, at least I'll take it that way. But what started this thread was a "feature" of the Windows 95 Email Exchange program that was causing the unwanted attachments to be added to replies only. Since I wasn't able to figure out how to turn that feature off (and apparently no one else has either) I've quit using Microsoft Exchange and am now using Pegasus Mail.

So now we can get back on topic I hope! (Anxiously awaiting WinAPRS)

Keith

Just got done with the Dallas Marathon.
Met Bob Winingham and even tracked him on APRS. He showed me the map you did for the area. DeLorme?
It was nice. We played with MacAPRS at the dinner table in the BBQ place last night as well.

APRS worked well for the marathon, but since I was not as familiar with Mac, we used a the laptop of Claude Head and his APRS version 7.0

We'll be posting the track file soon.

See You later.

Ralph

BTW- I did get a few chances to rag on Bob W about his Mac, though. I wouldn't be me if I didn't :)

With the day of attachments, that is now a reality. I've not gotten a CERT message concerning this, however. Sounds like a reprise of the fabled "Good Times Virus" which actually was a fake, and caused its disruption by the bandwidth it wasted.

I suspect most of the folks with the attachments are running Windoze9x. The mailer is hosed. Microsoft is aware of it, and has told folks I work with who tried to get a fix that it would not be a problem if everyone was running Windoze 97. for the record, Eudora doesn't have the problem.

If you are going to be using APRtrak for the upcoming SPARTAN payload to be launched 11 January, be sure you get version 0.5. The first release was version 0.4 at the Orlando AMSat conference in October. Its flaw is that it is STUCK in Eastern Daylight Time Zone. It will work by forcing your clock to EDT time zone, but there have been a few other improvements also, that should encourage you to get 0.5.

You can see the version # on the start-up screen and on the F1-Help screen. Version 0.4 will be dated in October, and version 0.5 will be dated in November...

Before 11 Jan, I will put out some helpful hints on operation. In the mean time, play with it. A good practice is to use it to monitor the MIR downlink. Read the various README files until then... Good luck.

> numbers and letters are displayed at top of screen

APR REPLY: He should be at the standard rate of 2400 for all ULTIMETERS. He should use the U-2000 in the mode which outputs continuously if he is dual ported. He should use the packet mode if he is making a REMOTE WX station.

In the U-2000 the output may already be RS-232 and not need the -v pull down resistor like the U-II required... Ill check...

284. GPS45 & KPC-3 Tracker

Rendered body type: text/plain

On Friday, I received my Garmin GPS-45. After about 30 minutes of checking manuals and doing a bit of soldering, I had the tracker up and running without any problems. The settings may still need a bit of tweaking but that should not be too much trouble. The KPC-3 was configured to provide power to pin 25 of the DB-25 connector and the GPS-45 power/data cable was wired accordingly (w/.25 amp fuse). Power to the KPC-3 comes in via the usual coaxial power connector. When running mobile, I use the Radio Shack window clip with a 90 degree BNC adapter to mount the antenna outside of the cab of my truck. Still need to do something for a radio for the tracker but my mobile rig will suffice for the time being. Now, all I need to do is get APRS running on my system at home so that I can see the tracks. I have not checked but I believe APRS will run on a 286 with CGA video (never felt the need for the latest golly gee whiz computer).

Let me know if you've seen KC6HUR show up in the Balt-Wash area.

285. HONOLULU MARATHON LESSONS LEARNED

From: DDOBBINS@aol.com
Date: Sun, 10 Dec 1995 23:28:50 -0500
To: aprssig@tapr.org
Message-ID: <951210232806_50482119@emout05.mail.aol.com>
Rendered body type: text/plain

APRS was present at the 23rd running, and the largest ever, Honolulu Marathon on December 10th. Still awaiting the final numbers, but there were an expected 32,000 finishers at this year's race.

Here are my observations:

- 1) We had APRS set up in the "communications" tent, sharing with MARS, Voice Ham, Police, and medical. The medical treatment tent was right next door.
- 2) I used APRSDR program. It worked as advertised. I extracted an area from the Oahu map that covered the race route, then added the purple #13 line segment over the route. I added mile markers and first aid stations for visual reference. I used a laptop/display for me, with external color monitor pointed toward the rest of the gang.
- 3) We had two GPS standalone trackers in operation, for the LEAD MALE and LEAD FEMALE. These were mounted in electric pickup trucks and did not experience/cause any interference. Both trackers used KPC-3 and Trimble GPS units, one had an HTX-202 and the other an MFJ-8621 data radio. Both performed flawlessly. Position reports were sent once each 45 seconds thru a RELAY,WIDE digi, every 2 mins for the WIDE digi, and every 10 mins for the WIDE,GATE,GATE,WIDE digi. We needed to buy cigarette lighter splitters for both vehicles and the "black lights" used to highlight the time clock atop the vehicle also needed to be plugged in.
- 4) On the eve before the race I reprogrammed the calls of both TNCs to LM and LF, then input the actual owner's call in the BTEXT @ 9 mins. I checked operation on my Macintosh at home, and both locked on and tracked. HOWEVER !!!!! on the next morning when I activated APRSDR I could see the position reports across the screen, but APRS WOULD NOT LOG OR TRACK THEM. OUCH !!! My first suspicion was right, the call sign must include a number. I remotely changed the LF TNC to 6LF, and it worked. For some unknown reason (I haven't checked it yet) I could not log on remotely to the LM. Therefore, I input the LM manually and tracked it at 9 kts.
- 5) I input the LHC (Lead Handicapped - wheelchair) at 14 kts, but don't know if that was close enough. Gotta admire that gang. Wow!
- 6) I input the Bikes at 12 kts. I remember seeing the first wheelchairs finish before the bikes. Can't believe that, but that's what I saw.
- 7) I input the lead group of the pack at 6 kts. That worked out just fine.
- 8) There was only a little interest displayed in APRS. None of the race coordinators or officials came over to see the display, but we did respond with position information at least a minute ahead of the voice reports. Our "visibility" issue is one we'll improve on next year.
- 9) The general response to APRS was:
 - What is that? Wow, way cool. (When I heard this I had to look up to

see if Keith Sproul was here)
or
- What is that? Oh, ok

Overall I'm quite satisfied with the APRSDR program. Comments from the field confirmed that as the APRS gang logged on and watched the race from the comfort of their own home. Msgs were minimal, so not a disruption.

What I'd like to see:

- a) A symbol for a runner.
- b) Ability to enter LM or LF or Pack or whatever as the mycall of the TNC, and have APRS process it.

That's about it. I've been an APRS user now for almost 3 years and this was truly the first time I've USED APRS for some benefit. I encourage you APRSers out there to find some civic activity and get involved, like the support to balloon events, DFing, sailing races, etc.

Aloha. Now that the race is over, it's time for the beach. Dave.

286. Hawaii MARATHON OOPS!

What got Dave "the-morning-of" the marathon and not tracking the callsigns of LM and LF was a GOTCHA.... Sorry...

But in all the error checking that APRS is doing to try to understand all the packets and to reject things that don't look like good packets, I have made the assumption that CALLSIGNS are at least 4 characters long!

But then I backed off from that when I needed my first 3 letter application. SO APRS NEEDS TO SEE AT LEAST A 3 LETTER CALLSIGN ON THE AIR.

Yes you can SEND shorter "names" for OBJECTS, but NOT for on-air calls...

Sorry dave...

I just posted MSmaps02.zip which is the result of a few hours worth of tweaking the raw 1 mile maps produced by KE4EER using MKMAPHK. I posted a long detailed description of the processes I go through to take the minimum street level detail and then try to put it together into a system of "seamless" maps. A picture is worth 1000 words. If you want to see how I took the 12 original 1 mile maps and combined them into only 4 maps plus added detail to the original 8 mile map, then zoom into these maps of Hattiesburg Mississippi.

I did this in anticipation of a commercial application. If the paying customer comes through, then I would consider these maps to still need another round of effort on my part to build redundant layers of maps going north and south, to provide seamlessness in that direction also...

To see the flavor of what I did, use the MAPS-BORDERS command. You won't see the original 1 mile grid (4 maps horizontally by 3 maps vertically) but you can see the result of my combinations...

This rumor goes around from time to time.

Viruses must be run in some manner (executed) in order to bring them to life - so to say. The typical ones are stored as programs although there are other ways to do it. There are a number of sites on the Internet that go into more detail.

Viewing an e-mail, attachment in an e-mail or even saving the attachment shouldn't cause any problems. E-mail and attachments are just data files. They are not run or executed -- they are just saved. What happens though is that someone sends you something as an attachment (program), you save it - then you want to look at it -- you run it. Then you if the program is infected -- you probably have it.

Just receiving mail (data) from someone via your e-mail account, should not infect you with any form of computer viral infection. Especially if the attachment is a text file.

So -- feel safe in using e-mail.

The secret to having safe software is:

1. Run a virus protection/detection from time to time.
2. If you like -- run scanning software on new software or keep it running all the time.
3. Backup your system and make sure you keep at least a set of old backups around in case something goes wrong with a virus. A lot of time people backup over the old data tapes, without saving at least one generation of backups. If you keep a backup and you do get infected -- and you can't eliminate the virus. Just wipe everything and restore.
4. Like any virus -- if you frequent community areas -- you have a good chance of catching a cold from someone else.

Just to put this in perspective, I have never had a problem with a virus (knock on wood). Most people I know don't have problems with virus infestations. Just use common sense and if you download something -- and you don't know the source be sure to check it.

Now go forth and have fun and don't worry -- just take the necessary precautions.

Cheers - Greg

. I may be a newbie... but isn't 10151.5 _MHz_ X-band microwave, not HF?
.

I don't know anyone from the KC7KEZ club (although I've been to their home town - in one of the most beautiful areas of the US, IMNSHO) but I'm pretty sure they meant 10151.5 KHz, which is in the 30-meter amateur HF band.

WAR coordinating packet?? WOW!!! That's news to me! I was under the impression that digital modes were coordinated in WI by WAPR (Wisconsin Amateur Packet Radio) via Steve KE9LZ. As far as specific coordinations of 145.79, I know not.

If I am incorrect about this PLEASE inform me - inquiring minds want to know ;-)

Merry Christmas

>APR REPLY: He should be at the standard rate of 2400 for all ULTIMETERS.

>He should use the U-2000 in the mode which outputs continuoiously if he is

>dual ported. He should use the packet mode if he is making a REMOTE WX

>station.

He is two port. I assume (correct me, if wrong) that the program sets the Wx computer comm port for the correct speed--2400 baud. AND, that the speed setting selected during program initialization (in his case 4800 baud) only affects the TNC port.

>In the U-2000 the output may already be RS-232 and not need the -v pull

>down resistor like the U-II required... Ill check...

WX.TXT has the following line which leads me to believe that a different cable should be used: "The U-2000 is directly RS-232 and needs no pull down resistor." However, N3HPR said that documentation (and the salesman, who he talked to, and who knew that he was interfacing with APRS) did not indicate that the cable was different. There is a cable and software package offered with the U-2000. But HPR did not use the software package he bought with the U-II so he didn't order the software for the U-2000. I suspect that that cable is different. And this is the real problem. He will have to talk to them and possibly order that cable. He wants to keep the other cable as he is planning to run the U-II as a remote unit from his summer cottage.

When we get this all straightened out, we'll report back to the SIG the final results.

There must be a software bug got into the Tapr systm again hi. In an attempt to connect to FTP a file i got the message connection refused. O well things like that will happen when playing with Bits and Bytes i guess.

I wanted to upload a revised map layout for Hattiesburg,MS that i would like APRS users to download and look at and give me some feedback on how you like the setup. I am constanly trying my best to improve on the street level map layouts. When installing these maps there's also a text file that will be placed in your readme directory i would like you to read this before trying the maps so you will know what to look for in this layout. Hopefully with all of us mapmakers working on these we can come up with the most usable layout for all of us. PLEASE take a look at these and don't forget the feedback (Flames or otherwise)(Good or no good), Thank you.....
By the way if i can get to upload the file it's name will be MSMAPS03.ZIP

Message forward to APRSSIG

From: "willf@rrgroup.com" "Willson Flor"
Subject: Attached Garbage

11-DEC-1995 15:59:46.30

Well, if *this* message also has no garbage, I have indeed found the trick.

Unfortunately, for reasons completely unrelated to this, my ISP (my employer) has "lowered the boom" about an hour ago as I write this and decreed that nobody here may use e-mail, web access, etc. for *anything* other than traffic related to our business, which is (of course) unrelated to APRS. Therefore, I have unsubscribed to APRSSIG :-(

If you would like to post it, or just file it away for reference, here it is:

In Microsoft Exchange *Server* set every domain to which you send mail as a domain to *not* send MIME-encoded files to (MIME is the default, and *every* domain has to be entered seperately.) Then, when responding to e-mail, formulate your response and *paste it* into a new message, then send. As long as you don't respond, but instead send a new message, and as long as it's not MIME-encoded, the problem seems to not exist.

73 de KB9JTT (Just a few miles from the Great Lakes, but oh so far from the APRSSIG.....)

Hope to be back on APRSSIG with a different ISP soon - 'til then, see you on the radio.

I have been following the SIG for about three months, but just recently got <on the air> with MacAPRS. It is very cool. My current system consists of a Mac Iici running version 2.1.2, Yaesu 736R and AEA PK-232MBX TNC. There are some areas of APRS in general that the documentation that I have access to hasn't addressed. Some of the questions relate to a subject near and dear to your hearts: UNPROTO PATHS.

1. I understand that the only way for my station to be seen outside of the region, as I am now only transmitting on 145.79, is to put at least one GATE in my UNPROTO path. Is there anything intrinsically <wrong> with wanting your station to show up on everyone else's map?

2. What is the <proper> sequence for that GATE, and should there be another GATE as well? This assumes that my fixed station would only be transmitting less than once per hour.

3. Since in addition, I have an HF rig, an AEA PK-232MBX TNC and a Mac, is this system capable of being be used on HF?

Please feel free to answer me directly: JayMillard@aol.com, or here on the SIG if you feel others might benefit.

Thank you in advance,
Jay Millard KD1LY

I'm not sure about distributor prices but Peet Bros themselves have a couple of specials running till the end of December. The first deal is a price of \$199 for the U-500, regularly \$239. The other deal is a special upgrade price of \$199 for the U-2000, regularly \$379, for anyone with the U-II. The upgrade package does not include the wind sensors; the U-2000 uses the same ones as the U-II.

304. Meteor Scatter test 14 Dec

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Mon, 11 Dec 1995 21:04:45 -0500 (EST)
To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.951211204147.16745A-100000@greatlakes>
Rendered body type: text/plain

The nationwide 2m and 6m packet meteor scatter test will begin at 0000 UTC on 14 Dec, the evening of Wednesday, 13 Dec. All packet stations are invited to participate. For more info see the Dec QST column by Stan Horzempa. We will use 50.62 and 145.79 IF AVAILABLE in your area.

If you are going to use the Meteor Scatter mode in APRS, please note the following caution/addendum: In APRS versions prior to APRS74e, I miscounted the 4 sections of the US. In the menu I numbered them 1 to 4, but in the code, they are numbered 0 to 3. Use the following table to figure out what you need to do to transmit on the right schedule...

SECTOR APRS74b SECTOR TO SECTOR TO ENTER IF

| OF USA | MENU | ENTER | USING APRS74e |
|--------|------|-------|---------------|
| NE | 1 | 0 | 1 |
| SE | 2 | 1 | 2 |
| SW | 3 | 2 | 3 |
| NW | 4 | 3 | 4 |

The version 74e will be posted on 12 Dec.

READ APRS\README\METEOR.txt for details...

REMINDERS: EVERYONE MONITOR!

Do NOT transmit unless you have a BEAM and plenty of power
APRS will schedule all transmissions IF your CLOCK is correct
and IF you have selected the right SECTOR.

If you live near the 39th latitude or 96th longitude, then
everyone in your area should agree on which sector to use.

Choose your sector based on where you ARE, but also consider
where your beam is pointed and when your target area is
transmitting.

What this means is, if you are in mississippi, dont beam SE, because
everyone to your SE will be transmitting when you are, so no one will
hear you! Always point to one of the other three quadrants.

You suspect correctly. From what I recieved from Peet Bros. the U-2000 is RS-232 on it's
com port. They faxed me a pin out for the cables to both a 9 and 25 pin serial
connector. They did not call for a pulldown resistor and only indicated a grnd, TX, and
RX line connections.

Here is question for BOB, do they use Xon Xoff for flow control?? Or is aprs simply
ignoring that comport until it needs the data?

Bob, does this mean that any APRS station normally operating on 145.79 but
not participating in the Meteor Scatter test should suspend operations as of
0000 UTC on 14 Dec 95? If so, for how long?

Just to let everyone know that may not already the attachments ARE NOT done
intentionally. I started the subject after my system crashed every time I read
or even attempted to delete the message (without even reading it!). The message
was posted to see if it was just me or others had the problem.

As has been STATED BEFORE the files are created by Microsoft Mail, not by the
sender but by the program. The few users that do have the program are now aware
of the situation and I know of at least 1 user that is no longer running the
program due to the problem.

Again the attachments are not intentional, it is a problem that Microsoft has
created and with more and more users of Win95' trying the program I am sure we
will see it again as we gain new members on the sig. if a new sig member is not
aware of the problem just e-mail him/her and let them know of the situation,
they are probably clueless that this is happening.

APR REPLY: 3 Meteor Scatter packets over 1000 miles distant were received by at least 3 different stations running omni antennas. One was in an attic! Although rare, you may as well LISTEN. The fewer packets you send for those 24 hours, the more all your neighbors have a chance of hearing a DX packet.

RECOMMENDATION FOR ALL HIGHPOWER STATIONS AND STNS WITH BEAMS:

Set MScatt mode and aim your beam in a different direction than the other aligators in your area are aiming. Set a high duty cycle

RECOMMENDATION FOR ALL OTHER APRS stations:

Operate MScatt mode but at a low duty cycle
By being in MScatt mode, you will only copy stations heard DIRECT.

Even if you dont see any MScattt packets, you may be surprised at how many stations you hear direct!

For those that have been asking me for a copy of the screen grabber i have uploaded the file to tapr under the file name GRAB397.ZIP. I didn't want to do this at first since it really isn't related to APRS (Well it almost is). It does a great job of taking a picture of your APRS screen and outputs the into an executable (EXE) file that's great for club demos and APRS gatherings, it also has software included to covert the EXE file into GIF or PCX files. Several APRS users have asked me to make it available so they can take some APRS screen pictures and use the GIF files to place them on their Web home page.

I have also included a txt file so APRS users will know what the file is all about and so they won't mistake it for a new version of Bob's or Keith's APRS software Hi Hi.

I've been using APRS for about two weeks. Really cool. I run up to 40 watts into a 13 el (vertical) yagi about 40 ft above the surrounding terrain. I am up on a ridge. Am I considered a highpowered station with a beam? And if so, hey Ralph, (N4NEQ): I'm in Atlanta, which way should I beam?

Another question: at what % of the channel load is chatting no longer considered appropriate? Or is chatting every appropriate? Friday evening, I did not expect it when a station wanted to chat using the tailing comments.

To: aprssig@tapr.org
Message-ID: <199512121435.JAA19079@neptune.gsfc.nasa.gov>
Rendered body type: text/plain

I recently tried operating mobile in the HSP mode (Motorola
Traxar+ GPS, Pacomm Handipacket w/their HSP cable,
IBM750C laptop) but kept getting screen lockups after a few
minutes. Plenty of CPU speed & memory. The screen will freeze
for long periods, interrupted with brief updates. In the "V" mode you can
see that the data from the GPS & rcvr keep coming in, so it's not a
program crash, but seemingly, the computer keeps too busy to update the
screen except very infrequently. Tried playing around with the Posrate
and frequency of updates from the GPS (Can only vary from 1 to 9 sec),
but no luck.

Has anyone had this problem and/or a solution? I had been operating
standalone or as a tracker without any trouble.

>Mark
>KD6KQ
>

If you're considering the U-2000 system, you should order the U-II system directly from Peet Brothers for \$179 -- with the U-2000 display for an extra \$199. (Special "upgrade" price through the end of December.) The total cost for this package is \$378, a buck CHEAPER than the U-2000 system sells for BY ITSELF.

This will give you the ability to use the two displays in different locations within a hundred feet or so -- a nice feature if you want to use one in the shack and the other in the house. (You will need to purchase an extension cable or make your own using eight-pin modular connectors.) The U-II display does not provide as many memory registers as the 2000, and cannot display barometer or humidity/dewpoint, but it will show temperature, wind, and rainfall data.

Peet Brother tells me the wind speed/direction sensor shipped with the U-II system is totally compatible with the U-2000 -- the only difference is the color of the Lexan plastic.

WAR coordinating packet??

WAR is not coordinating packet. However for lack of anyone else doing the coordination we may have to - by default.

I was under the impression that digital modes were coordinated in WI by WAPR (Wisconsin Amateur Packet Radio) via Steve KE9LZ.

That is my understanding - that he is supposed to do that - but - as far as I can tell he hasn't.

As far as specific coordinations of 145.79, I know not.

I thought that your original message specifically stated that YOU had gone to a great effort to get that coordinated.

Personally - I think that the frequency ought to be coordinated nationwide. _I_ have submitted the issue to the national coordinator's remailer and urged their speedy action. The ARRL is even involved <g>!

I (as a former cop and judge) resent rules and regulations as much, or more than the next person - but unless we do a little spectrum management we are going to lose the frequencies - the FCC will decide that we are more trouble than we are worth.

Pray tell - what is all that "stuff" at the end of your message?

Merry Christmas!

322. MKMAPHK2.EXE Upgrade

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Tue, 12 Dec 1995 12:35:49 -0500 (EST)
To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951212123218.25667A-100000@greatlakes>
Rendered body type: text/plain

Just talked to Jack Cavanaugh and he said the only difference in the UNPLOCKED map files from the interenet and the BLOCKED ones off the CD, are of course the CR-LF at the end of each 80 character block. But since he reads the files as RANDOM, the only difference is to change the OPEN FILE statement... LEN=82 to ... LEN=80 and it will work fine off of UNBLOCKED files. I added a USER PROMPT allowing you to specify BLOCKED or UNBLOCKED and re-compiled the program as MKMAPHK2.EXE and it is included in APRS74E. The MKMAPHK2.bas source code is only in the UPGRADE file 72cto74e.zip...

Hope this helps...

Rendered body type: text/plain

Latest APRS and one upgrade file are now posted.

- * Fixes Meteor Scatter SECTORS to 1 thru 4 vice 0 through 3.
- * May do band switching with PK-900/2232... (and of course, maybe not)
- * New <> keys will hook-step through all stations on current SCREEN. This makes it easy to zoom into an area, and hook everyone in turn to see what is happenin'. Actually, its the "," and "." keys so that you dont have to hold down the shift key while pressing the < and > key...
- * Fixed the cursor display in MAPFIX18 to avoid truncation errors at small ranges near even LAT/LONG lines.
- * F3/F4 work better for changing number of displayed labels. Actually SPACE BAR restores to normal labels. F3 brings up more. F4 should bring up less, but DONT HIT SPACE, hit HOME instead to re-draw without defaulting back to standard labels..
- * Fixed the wrap-around which screwed up the HOOK-DISPLAY in 74c.
- * Version 74d was a BETA test of some of these and was not intended for general distro.

Rendered body type: text/plain

On Tue, 12 Dec 1995, Randy Hall wrote:

> Does APRS74e.zip address the picopacket issues?

APR REPLY: Yes, I forgot to say, that 74e WILL automatically request a GPS posit from the new-dual-serial-port-gps version of the PICO-TNC.

This means that you just plug the GPS into the PICO-TNC and plug the TNC into APRS, and you don't need the HSP SWITCH! All you do is configure APRS for HSP, but when you first started APRS, you told it you had a PICO. APRS will then know to request the GPS posit over the serial port from the TNC...

325. Virginia maps

Rendered body type: text/plain

Hello

I have made 40+ maps of Virginia at the 8.4 mile range. The centers of the maps are horizontally 20 minutes apart and 15 minutes vertical separation. I found this grid size to give a good continuous map at the 8 mile or less range. I am missing some maps from my grid for some reason I cannot generate the missing maps from my Internet data? I have not begun to label this maps yet and no city locations are included. Most of these maps are small in size 1500 points, so they load fast on my slow notebook.

If anyone is interested in the data I have at present I will be glad to zip and upload the maps and maplist.va, to the tapr ftp site. I had hoped to wait until I had a completed set of 8.4 miles of my state but who knows when that will be!!

Let me know if you are interested, but
PLEASE DO NOT INCLUDE A COPY OF THIS LETTER WITH YOUR REPLY
There is entirely too much repetition here, a simple phrase in the subject line is usually (but not always) enough to let folks know the contents of your email. Gosh I see 20 copies of some letters that get heavy replies,,, that's 20 copies recent to 200 users. This is a great source of information and I really enjoy reading all the new info and discussions of old topics. But I am not interested in personal mail to Elmer@someplace.USA send it to Elmer not the Aprssig. Wow all that flaming I have been ready is affecting me now....he he

Rendered body type: text/plain

I dont know if everyone is seeing all the mail, but I hope all APRS users are aware that the next Shuttle mission scheduled for 11 Jan will have the SPRE on board the SPARTAN PAYLOAD. SPRE was built by a group from the Univ of Maryland. SPRE will operate for 24 to 48 hours as a satellite detached from the Shuttle. It will send down its GPS posit in AX.25 packet (not APRS formatted) but the format WILL be plotted by APRtrak that has the sepcial X-Y-Z decoder in it.

Also APRtrak willl plot the TELEMETRY on the TELEMETRY page.

But the GREAT news is that the SPRE will also digipeat APRS position reports!

We do NOT want to OVERLOAD the uplink, but we also want to be sure that a good number of stations try to digipeat their grid square via the SPRE digipeater. PUT IT ON YOUR CALENDAR! It will only last a day or so, so BE READY and understand all about APRtrak or the SPACE mode in APRS...

332. Virginia maps uploaded to ftp site

334. TNC,9600 baud

From: "Michael Turner" <mturner@fox.nstn.ca>
Date: Tue, 12 Dec 1995 21:58:05 -0400
To: aprssig@tapr.org
Message-ID: <199512130258.WAA10488@Fox.nstn.ca>
Rendered body type: text/plain

I intend to buy a TNC specifically for use for APRS. Should I choose one that can be upgraded to 9600 baud?

335. Re: [APRSSIG:5121] TNC,9600 baud

> one that can be upgraded to 9600 baud?

I recommend the KPC-3 for mobile APRS use. Its compact, energy efficient, low-cost, and is the only TNC that can be remotely reconfigured. Best price for it is about \$115.

I wouldn't bother with 9600 unless you have a need NOW. My general philosophy with anything electronic is to only buy what I need today. Never pay more to get features that I *may* use later. When later comes around it will be cheaper.

> interface for comparison?

Peet's rain gauges are elegantly SIMPLE! They have little cups that tip over whenever they fill up. As the cup tips it momentarily closes a switch. All the Ultimeter has to do is count switch closures. Each closure represents .1 or .01 inch, depending on the gauge model.

Well, that is not strictly speaking correct. I'm fairly sure the KPC-9612 is also remotely reconfigurable. I don't find that a particularly important feature though. I have yet to setup a remote station that I need to change the operation of (I have yet to setup a remote station).

As soon as I get off my lazy behind and make a few cables I will have a PicoPacket w/ 2nd Serial & Battery to go with my KPC-3 (permanently in the car for mobile packet) and my KPC-9612 (at home for desktop use).

Subject: [APRSSIG:5118] APRS Satellite 11 Jan!
From: aprssig@tapr.org at Internet-Mail
Date: 12/12/95 19:32

I dont know if everyone is seeing all the mail, but I hope all APRS users are aware that the next Shuttle mission scheduled for 11 Jan will have the SPRE on board the SPARTAN PAYLOAD. SPRE was built by a group from the Univ of Maryland. SPRE will operate for 24 to 48 hours as a satellite detached from the Shuttle. It will send down its GPS posit in AX.25 packet (not APRS formatted) but the format WILL be plotted by APRtrak that has the sepcial X-Y-Z decoder in it.

Also APRtrak willl plot the TELEMETRY on the TELEMETRY page.

But the GREAT news is that the SPRE will also digipeat APRS position reports!

We do NOT want to OVERLOAD the uplink, but we also want to be sure that a good number of stations try to digipeat their grid square via the SPRE digipeater. PUT IT ON YOUR CALENDAR! It will only last a day or so, so BE READY and understand all about APRtrak or the SPACE mode in APRS...

Tp: Bob Bruninga

I apologize for probably not addressing this message properly, but it is my first attempt to write TO the Sig (which source of info I am enjoying immensely)!

And sincere tnx to YOU, Bob, for creating and developing the APRS programme. Am having a great time with it! (Yes, I am REGISTERED hihi!)

I have downloaded the V.74E from two sources - ftp.cdx.net and the ProjectX BBS. The former gives me a ZIP file of 1127295 blks and from the latter source I get a ZIP file of 1123845. Both packages unzipped alright and, when installed seem to work as they should (as far as I can see). Is the fact that the package sizes are different significant?

Also, when on line with either of the 'new' 74E prgs, they seem to be indicating in the packet info sent out from time to time that I am still using 74C .. although the opening screen does indicate 74E .. Should this be?

Minor points, I agree .. and sorry to bother you with trivia .. but I am interested.

TNX agn, and 73,

John VE3ASX.

Hi Bob, I have tried everything on God's blue earth to get the 2000 to transmit the weather on a remote type set-up using the AEA PK12, & APRS74c. I have tried many combinations of commands to no avail. I called Peet brothers and got the header 'SULTW' for the packet mode. They said they were also trying a 2000 with APRS and couldn't get it going. In your text along with the 74c release you mentioned the LFIGNORE must be "on" Do you know what the equivalent command is on the AEA?? You have developed quite a program and we are looking forward to working with it. We are coordinating our weather output with the National Weather Service in Grand Forks, ND. Soon we will have 5 or 6 remote weather sites in operation.

Any help you can provide with the above will be appreciated. If more info is needed please let me know.

Sincerely

George A. Welte N0WBU

Hi John..

As the "owner" of Project X, I can vouch that the files you downloaded through the system of Project X are in fact the "real" thing. The file size difference is due to the fact of the header to identify where the file came from and also due to the fact we have rezipped the package and verified the fact there was no virus present in the system.

You will also find the latest APRS maps for Ontario region available at both the Project X LL BBS (905.792.7890) or

To: aprssig@tapr.org
Cc: amsat-bb@amsat.org
Message-ID: <Pine.SUN.3.91.951213190248.20591A-100000@greatlakes>
Rendered body type: text/plain

In case you forgot, tonight's the big night for the 2 meter and 6 meter USA nationwide Meteor Scatter PACKET test. See details in Dec QST. For all APRS stations, starting at 0000 UTC 2000 EST use FILES-ZERO to clear all your pages and set ALT-S-MODES-mscaT. Then if you have a beam, point it towards a city 600 to 1200 miles away that has APRS activity. If you have anything over 50 watts, then set your XMT duty cycle to 100%.

Low power stations should set duty cycle to less than 10%. (so you dont QRM everyone else in your area trying to LISTEN)

The only time for HIGH power stations to set to less than 100% is if you also want to LISTEN a little bit for other stations in your same timing SECTOR. Florida stations, for example, may want to listen a little bit for other SE stations which are NW of them, but still would be transmitting in the same #1 time frame. Similarly, for New England. READ METEOR.txt and think it all through...

ALSO be CERTAIN your PC clock is within a few seconds of real-time, or all this scheduling is out the window. If you are serious about DX, then you might want to put your PHONE# in your BEACON.

It is best NOT to send APRS MESSAGES, because that REMOVES your grid-square from your packets and no-one else will KNOW where you are...

Of course everyone must use the same freq of 145.79. Be sure it is available in your area before you transmit. Even if it is coordinated to someone else, it wont hurt to LISTEN for weak DX packets that might come in...

>In case you forgot, tonight's the big night for the 2 meter and 6 meter
>USA nationwide Meteor Scatter PACKET test. See details in Dec

Early-early results! I have our IBM club station, WD0GNK set up using APRS and transmitting beaming ESE from here in Rochester, MN. I set it up around 4:00 CST while I was at work. To make sure things were working as desired, I had my home packet station turned on to 145.79. I called my wife, KB00ND, had her start the packet program and monitor my packets. All was working as desired. When I got home, we went to the Rochester ARC pizza party. Forgot that I left my home station on. When we got home from there (through the miserable icy-snow), I thought I'd check my email. While I was at it, I kicked up paKet and checked the heard list in the TNC. Wow! Only 8:00pm CST and here are the non-local stations on MH list:

17:06 N7VLR
16:55 N0JVB
16:54 W7KB
16:49 W3ADO (Hi Bob!)
16:46 N2CZF
16:36 VE2JOR
16:22 K1VOW
16:15 NP2IJ
16:01 VA3GOG
15:42 KN4IM
15:40 WB5TKC

Equipment here is an old Azden PC3000 running up to a homemade 4 element J-beam - pointed nearly NORTH! Hm.

Any chance I'm getting these digipeated? Since I didn't have anything logging the packets, I don't know what I really saw. Still, I'm impressed. May fire up APRS tonight and let it run.

73!

To: aprssig@tapr.org
Message-ID: <Pine.SUN.3.91.951213215326.21003A-100000@greatlakes>
Rendered body type: text/plain

Even if you do not see a single Meteor Reflection, one thing that 24 hours worth of METEOR SCATTER mode can do for you is to calibrate your PHG curve! (and show you the value of digipeaters!)

My map looks awfully bleak in Meteor mode (DIRECT FILTER IS ON). Instead of 5 pages of posits going out 150 miles in both directions, I see 8 stations within about 15.

BUT! When I hit MAPS-LOTS-POWER, Everyone of those stations intersects

with my PHG circle! And my PHG does NOT go any further. This tells me that my PHG pretty well reflects reality. This is a good test!

If you clear your screen and run MScatt mode you will only see DIRECT signals from onther stations. A great way to infer your radio range...

> non-local stations on MH list:

APR REPLY: Looks more to me like someone left your local area APRS HF gateway running. Most of those calls are the guys I see on HF every day..

Unless your HEARD Log stores the path, or somehow marks those signals that it heard direct, you have no knowledge of how they got there, hi hi...

If you run APRS in the MScatt mode, then it will ignore ALL packets except for those that it hears DIRECT... It will capture the full packet, plus you can see the proof that they were direfct on the D page.

BUT THE D PAGE IS NOT SAVED IN THE BACKUP FILE!!!
So BEFORE you stop APRS over the next 24 hours, BE SURE TO CHECK the D PAGE before you hit QUIT.

John, at the moment I can not explain it, I downloaded the files from TAPR to my home computer using ws_ftp32, and turned around and uploaded them to my web page on CDX. On my home computer aprs74e.zip is 1127295 bytes also it is that size on TAPR and also on Projectx. I took me a while to check it out as I could not get connected to TAPR when I got home by either FTP or web browser I will check with Barry the webmaster at CDX and see what he has to offer.

Will keep all informed, your host at web site CDX.NET

Hi Jim,

All the credit for the Web page goes to Dave Chesser, KA9NHL. He read a book on how to make a Web page and made one! It was his idea, along with Ed Rogers N9LCI, to get one going.

email addresses:
Dave KA9NHL davidc@tbcnet.com
Ed N9LCI edwardwr@skognet.com

The "times accessed" function seems to be governed by the Internet provider. Again, Dave can tell you more.

URL (the place on the Web to go) for the Northern IL APRS Network Page (NIAN) is:

369. APRS74E and PICO

From: barrettd@crpl.cedar-rapids.lib.ia.us
Date: Thu, 14 Dec 1995 07:28:52 -0600
To: aprssig@tapr.org
Message-ID: <199512141423.IAA10126@sys1.tapr.org>
Rendered body type: text/plain

Bob,

I didn't see anything in the new notes readme file about the pico paket mode. I having it working like I did in earlier APRS versions by setting ELO to on which echo's the Pico's GPS port2 to port1 which the tnc is on. I also set LOC E 3 so it echos the gps string every 30 seconds even though APRS will only send it at the APRS position rate I set.

Now my question what the heck does defining PICO, when setting up 7.4e, do exactly? I read a sig message that said PICO mode would request the GPS posit over the serial port to the TNC.

I've found the only way to make the picopakket work is to do the steps I outlined above. Not griping just trying to clarify things for myself and others. The pico has been just fine with 7.4b to 7.4e

Also are there any tips on using the Ultimiter 2000 with APRS I should know about? I have one on the way and should be in by Friday.

On another note to anyone that knows. What's the deal with texnet, Nexrad radar sites and packet. I grabbed the RMC decoder and I see a .79 site in Davenport, IA that becons on APRS as NEXRAD.

Can I connect to it and grab an RMC? Will APRS one day decode RMS text when one does OPS, Query, NEXRAD [next feature Bob? :-)]

Sorry about all the gabbing I'll sling back to lurk mode now.

PS That was my brother NM0B and I driving around illinois and Iowa last week. Sure like all the Chicago, Rockford Digi's and WX along the way.

APR REPLY: OOPS I left it out. As you have configured your PICO, it is sending its data OUT THE RADIO at the rate you established in the PICO and also echoing that to APRS. That works, but it does not give you nor APRS control over your position reporting. It also duplicates the on-air packets since both the TNC and APRS are sending posits. In this mode you are operating in the APRS "SPM" mode.

We worked with PacComm to define another way for it to work in HSP mode where APRS has control over the positions. You tell APRS you have a PICO. Then when you set GPS-HSP mode, APRS will send out a Ctrl-E each time it toggles the HSP switch. This tells the PICO to send APRS a position report (and to reset its POSIT TIMER).

ADVANTAGES: 1) APRS is controlling the position timing.  
a) You can force a posit at ANY TIME with the F8 key  
b) APRS will decay reporting period when you are NOT moving  
2) When the APRS is turned off, or laptop is removed from the vehicle, then the POSIT becons continue, since APRS is no longer periodically toggling the ^E which had been resetting the internal beacon timer.

Hello Sig Group;  
I have a question. I downloaded off the sig group the Grabber program to grab screens.

I have loaded grabber on occasions and also at other times grpcx. Both seem to grab the aprs screen and save it but I have never been able to save the screen I'm on.

I always use cntrl alt F1 to grab the screen when loaded grpcx. But I always get the logo screen of APRS, once I got the Beacon Screen, I have never been able to grab the screen I'm on, which is the map with calls showing on it.

Anyone know whats wrong, me or the program???? Thanks for any help

Jim, N4PUQ

KB1TX - in zero land, Aurora CO  
N3943.940, W10456.396, 5 watts, 3db Omni  
200 feet above average terrain at about 5656 feet

I doubt you will hear me, but what the heck!

NOTE:  
Apparently I am the only station "up" on APRS on 5.79 at this time in the metro Denver area. No "wides". I am "relay" and I "UNPROTO" digi through W0TX. System is on except when wife (N1DUZ) is using computer for non Ham software. So far I have not been able to keep APRS running reliably in foreground or background in Windows 3.1 on the home office P5 system. As soon as I fix a radio - TNC cable the APRS will be up permanently on a second computer and an old ICOM running 10 watts into a "venttenna" on a plumbing vent on the top of the roof. No outside antennas allowed in the tract so "stealth" is in order.

APR REPLY: APRS uses dual screens. It uses the the default screen for all text and uses the alternate screen for the map.

To save an APRS screen, simply run APRS from windows, press the PRINT-SCREEN KEY and then exit APRS. When you bring up PAINTBRUSH, you will find the APRS screen on your clipboard. Load it and have fun!

Message-ID: <199512142213.QAA04039@sh1.ro.com>  
Rendered body type: text/plain

Those that downloaded the Grabber software please read the doc's that came with the software. It's really a very easy to use program and i don't want to spend too much time taking up APRS SIG bandwidth to get into this program since it's only indirectly related to APRS. DON'T try to run anything other than the Grabber program, capture the screen THEN CONVERT it to another format.

### 387. Ltrack Lines from KPC-3

From: Doug Woodruff <102256.1216@compuserve.com>  
Date: 14 Dec 95 19:15:51 EST  
To: TAPR E-mail Forum <aprssig@tapr.org>  
Message-ID: <951215001551\_102256.1216\_BHB27-2@CompuServe.COM>  
Rendered body type: text/plain

Bob,

How do I configure the downloaded "Ltrack" lines from my KPC-3 so that APRS will put a symbol on the screen and plot their progression when playing the file as a track history? Have tried several ways but not successful yet.

The data is there but APRS doesn't want to plot any symbol for the positions. I have tried my callsign with a "-9" to make a car but seem to be missing an intermediate character somewhere. What is the format which must precede the coordinates for APRS to plot a symbol on the map?

Thanks,

Doug, KM4HY

### 388. Eagle AccuNav Sport GPS Receiver

From: Doug Woodruff <102256.1216@compuserve.com>  
Date: 14 Dec 95 19:15:50 EST  
To: TAPR E-mail Forum <aprssig@tapr.org>  
Message-ID: <951215001549\_102256.1216\_BHB27-1@CompuServe.COM>  
Rendered body type: text/plain

Just a quick note to mention a GPS unit which has not gotten any press here on the SIG.

I have used a Eagle AccuNav Sport (\$384.00 from Bass Pro Shops) for the past month. This unit uses a Rockwell five-parallel-channel engine which is extremely fast and more stable than the single-channel sampling Garmins. I use the unit from inside the car (the antenna on the dash) and have not had problems losing lock in heavy rain, going under overpasses or through forested areas. It is plug-n-play with a KPC-3 (the \$18 interface cable terminates in bare wires so you have to put an appropriate connector on), needs no initialization strings to commence sending NMEA-0183 data and will operate on any DC voltage from 6-35 VDC.

The unit is somewhat larger than the Garmin but seems to operate more reliably than the Garmin and is more sensitive. The antenna is connected with a two-point hinge and can be removed to accommodate a remote mounting kit (\$22). This eliminates the problems the Garmins have with the weak antenna connector loosening and causing intermittent contacts.

It will, of course, accommodate a differential receiver. Actually, it will accommodate two different types of differential receivers.

The unit outputs GLL and RMC data which APRS decodes but also outputs three other strings, including the one used for auto-pilot steering of boats.

In short, I am a very impressed and proud owner!

FYI,  
Doug, KM4HY

I hate to burst your bubble Bob, but the above line was clearly received via tropo skip from the nearest GATE, probably in Orlando but possibly WB90ML in Lakeland, or even me in St. Pete. KF0ZH is a regular HF WX station and the \* after GATE indicates the origin transmitter to you.

An MSCAT signal will consist only of a callsign and grid square.

73 and get a wide up so we can connect across the state!

Kevin KD4UYR

### 390. METEOR SCATTER

From: Wb2ngz@aol.com  
Date: Thu, 14 Dec 1995 19:39:11 -0500  
To: aprssig@tapr.org  
Message-ID: <951214193909\_90508060@emout06.mail.aol.com>  
Rendered body type: text/plain

Subj: METEOR SCATTER  
Date: 12/14/95  
To: aprssig@tapr.org

From 140400Z thru 141400Z I left my APRS station online here in Daytona Beach, Florida on 145.790 MHz looking for meteor scatter reports. The following data was recorded on my "V" screen:

KF0ZH>APRS,GATE\*,WIDE/V:@141518z4447.06N/09329.48W\_202/000/T025/R000/P000/U-II

Callbook research revealed Scott D. Lebens, KF0ZH, 1261 Limestoone Drive, Skakopee, Minnesota, 55379.

Looks like meteor scatter to me!

Bob, WB2NGZ

---

Well, this will be a first...An APRS SIG contributor is going to flame HIMSELF! The dummy who wrote the message above (Me) didn't notice the little \* after the word GATE in the received data line above which means that I copied the alleged meteor scatter from a GATE station in Orlando. Thanks to Rich, N4CZF, for bringing my stupidity to my attention. Oh well, wait til next year!!

Regards...Bob, WB2NGZ

Rendered body type: text/plain

The Micro-Interface-Module is a complete GPS position reporting and telemetry transmitting system on a single chip. It accepts 5 analog inputs, 8 bit inputs, and a NMEA string, and it outputs AX.25 packet tones and a PTT signal. Connect it to any transmitter and you have a device that can not only be tracked by APRS, but who's telemetry can also be displayed by APRS. Its small size (match box) and low power, make it easy to build small tracking applications.

We have just added an extended low-power mode. In this mode, the chip sleeps while only drawing 0.015 ma. It can be programmed to wake up periodically, turn on the GPS for 10 minutes, get a fix, and go back to sleep. It can wake up at a separate periodicity to transmit its last position and current telemetry as needed.

In this mode, you can build a package the size of a tall beer can which will update its position once a day, and report its last position and current status every hour, FOR A YEAR! This is using 6 standard ALKALINE D cells. LONGER on Lithiums! Just think of the applications!

Prototypes will be available in a few weeks....

### 392. help getting started

From: ldajz@epix.net  
Date: Thu, 14 Dec 1995 20:00:06 +0000  
To: aprssig@tapr.org  
Message-ID: <199512150059.TAA17116@epix.net>  
Rendered body type: text/plain

Hi and thanks for reading...

A few of us in NE PA are really trying to get VHF APRS rolling. We are all situated around Scranton, with three of us in the vally, but

three others at better elevations. We seem to have made progress between us, but can't seem to get reliable postings sent throughout our system. In other words, the well situated stations hear all of the juicy APRS stations from CT to MDC, but don't seem to send them to us "in the valley".

We have decided among us, that it is time to get set up on a mountain top repeater site, but with the bad wx, it may be Spring before that happens. So as for now, does anyone have advise as how to set the TNC's at the favorable locations (denoted as A,B, & C) and the valley TNC's (denoted as X,Y, & Z). Just for the record, A,B, & C hear X,Y,Z,& each other, but only X can hear and transmit to A,B,C,Y,& Z.

Mountains riddle this area and seem to be the root evil to our problem. I know this is quite a paradox, but any suggestions would be appreciated, even though it may have already been attempted.

X just happens to be me... Al, N3KAE ldajz@epix.net

I donno the exact format that is in the Ltrack, but if it is the raw NMEA gps strings, then it needs to be put in to APRS format. Use the GPSToHST.bas program.

You may need to modify the program slightly to match your exact format, but it should give you a starting point.

APR REPLY: This is know as the RELAY-RELAY problem. Everyone digipeats everyone elses packets and ANYONE that hears 2 other stations equally, will NEVER hear a 3rd distant station because the other two digi at the SAME time and colide at your station. YOU NEED A SINGLE DIGI that all can hear and you should address that digi with something other than WIDE!

> In other words, the well situated stations hear all of  
> the juicy APRS stations from CT to MDC, but don't seem to send them  
> to us "in the valley".

APR REPLY: Until the snow melts and you put up a real digi, have ONE of the best hillside stations set his ALIAS to WIDE. Then some of the distnat stuff that is addressed via WIDE may be digipeated by him down into the valley... Also, if anyone has a KAM, have him tune in 10.151 LSB and set his MYGate call to GATE, and he will then send out all the HF stuff into your valley too... (via the VHF side of his KAM or AEA-2232 or PK-900)...

### 395. MS report

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Thu, 14 Dec 1995 21:14:32 -0500 (EST)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951214210126.9589C-100000@greatlakes>  
Rendered body type: text/plain

Nothing, nadda, zip. 40 foot dish running 25 KW ERP pointed from Maryland towards Chicago shows no receive hits.

Oscar array pointed at Atlanta, Florida, showed no hits, but was only on about 50% of the time due to other needs for the PC.

#### COMMENTS:

\* I think we got far fewer participants this time than last..

\* Being in MScatt mode and not seeing anything on my screen but 3 locals instead of the usual 80 stations over 5 states seemed kinda lonely...

\* Conversely, you can set CONTROLS-DIRECT mode anytime you want (over night is fun) and see DX, band openings, meteor reflections any time you want! The probabilities will just be less, because no one is pointed RIGHT AT YOU with a 13 dB antenna. And their packets will be about 3 times longer... BUT THERE WILL STILL BE thousands of packets out there on 145.79, most of which will contain a POSIT! With DIRECT mode on, your APRS will ONLY capture those heard DIRECT, and filter out all other stuff!

You may be suprised at what you hear, if you can handle the withdrawal symptoms of NOT seeing all that other activity!

### 397. GPS, Altitude and general thoughts.

From: KD4EMI@aol.com  
Date: Thu, 14 Dec 1995 22:01:24 -0500  
To: aprssig@tapr.org  
Cc: DMOBLEY@encore.com, 0004818186@mcimail.com  
Message-ID: <951214220042\_54641008@mail04.mail.aol.com>  
Rendered body type: text/plain

I have been operating on APRS for about 1 year. The station at home is on nearly 24 hours a day. I also operate mobile tracker that consists of a Garmin 45 and KPC3.

Here is the reason why I write. In the year that I have had my garmin, I dont think Ive EVER got a accurate altitude reading. EVEN if the accuracy on the sat screen is 50 feet. (which it has been). The accuracy on the +/- altitude screen is less than 100 feet sometimes and yet the darn thing never really seems to come close. Now, that really doesnt bother me except when I got together with a few other aprs guy and we held our GPS'S next to each other, I mentioned the altitude. HIS Magellen (5000D) I think it was) was fairly accurate...Actually, it was really accurate and changed perfectly when we went up ramps and things on the highway.

I mentioned it to him, and he stated that he thought this was normal operation for GPS'S and was suprised at my reading.

Now...whats the deal..How do I know for example that the LOCATION is even close. ( I CAN GUESS BASED ON THE MOBILES PLOT THAT IT IS OK THOUGH-But thats a hell of a way to verify it)

What has been the experience with the other Garmin and other GPS users. Have you experienced this. Is there a upgrade that Garmin has done...? What strange anomaly is this ?

Is your data from the ltrack also in backwards order ie the top of the file list is the newest data?

That caused a small problem with MACAPRS this I use and I had to use a text eritor to swap the data to make it work.

-----

There should be a basic file in the docs to convert NMEA to hst.

GPStohst

```
PRINT "This program takes a RAW PROCOMM download file from a GPS receiver"
PRINT "in NMEA-0183 format and formats it to look like an APRS packet beacon"
PRINT "It looks for the GGA and VTG sentences."
PRINT
```

```
PRINT "For LORAN or other sentences GLL or RMC, you will have to rewrite"
PRINT "Several lines in the program..."
PRINT
INPUT "Enter file name of raw GPS data"; FI$
INPUT "Select NMEA sentence to use RMC or GGA"; NMEA$
INPUT "Enter name of OUTPUT file for APRS compatible TRACK HISTORY"; FO$
INPUT "Enter callsign to be used with the raw data"; CALL$
INPUT "Enter two digit DAY of data"; Day
```

In going back and forth between other applications and APRS during last nights meteor shower, I was constantly using the AUTO-LOAD-BACKUP option.

Though I would remind everyone about it, since I dont have any idea where it might be covered in the "docs"..

You may start up aprs with a "/" at the end and it will load the BACKUP file immediately...

COROLLARY: Since I also can never remember the "version-number-of-the-week" I always copy the latest APRSxx to APRS.exe so that all I ever have to do to start APRS is type APRS/b...

>gateway running. Most of those calls are the guys I see on HF every day..  
>

Unfortunately, looks like you're right. The ice storm did a number on my antenna so I saw nothing over night. (SWR at 5:1 - normally close to 1:1 at that freq.) More bad news - WD0GNK got nothing other than my station when I was had APRS running. I've had a bad feeling that it was somehow deaf - I've not been able to receive N0QVC just 30-40 miles

away when pointed at it. I receive that station at home with a much more modest station with no problem. So, it's not working like it did back in the August test. But I was running out through a brick so maybe something got out. ?? Wait and see.

I ran my station tonight with paKet for a while, logging the packets and saw W3ADO just digipeated here like you implied. Well, I hope we can get the GNK station in better shape by the next test.

### 403. Track history QUESTION?

From: Bob Bruninga <bruninga@nadn.navy.mil>  
Date: Thu, 14 Dec 1995 23:19:00 -0500 (EST)  
To: aprssig@tapr.org  
Message-ID: <Pine.SUN.3.91.951214230048.9833D-100000@greatlakes>  
Rendered body type: text/plain

Here I sit waiting for a mobile so I can see if the auto-save-track history is really working..

While pondering this, I am also ready to make a change in the way TK-HSTS are saved. If you OBJECT to this change, lemme know. Otherwise I will assume you agree with the change...

EXISTING LOGIC: Everytime APRS saves a track history, it FIRST saves a posit for all of the stations currently in the P-LIST. The logic was, that each track history file would then "stand alone" as a capture of not only the moving station, but also all of the other stations participating in the event.

THE DOWN SIDE: In our area with a full PLIST at all times, this stuffs 80 FIXED posits into every track history file (which only holds 199). NOT only is this wasteful of disk space, but it also requires manual editing out of these fixed stations when you go to combine multiple track history files.

PROPOSED ACTION: I will delete the automatic dump of the P-LIST into every track history file. If you want to see who all was on the P-LIST during an event, LOAD THE BACKUP file for the same time period. If you want a single summary file for the whole event, you can use an editor to CUT out the POSITS from the BK file and PASTE them into the TK HISTORY file...

FINAL NOTE: Remember, the track history will only be saved if:  
(1) the CONTROLS-LOG function is ON  
\*AND\*  
(2) the track history memory fills up to 199 entries  
----OR----  
(3) you do a FILES-SAVE command AND give a name \*other than\* BACKUP.

P.S. Three stations have indicated that APRS did NOT save a HST file when expected... but it is impossible to know what was the exact condition of their settings when this occurred. CAN ANYONE CONFIRM THAT RECENT APRS versions HAVE SAVED A TRACK HISTORY AUTOMATICALLY?

I don't want to go "fix" it if it ain't broke!

Where can I get more info on this? I am trying to build a GPS reporting system that will fit into a high performance model rocket.

About how much will it cost?

Could I obtain(purchase) a sample for beta testing and design?

Is there any documentation available now?

Subject: [APRSSIG:5038] Geminids Test Announcement  
Author: aprssig@tapr.org at Internet-Mail  
Date: 12/9/95 11:04 AM

Geminids Packet Meteor Scatter Test

Date: December 14, 1995  
Time: 0000-2400 UTC  
Freq: 50.62 MHz, 145.79 MHz (if available in your area)  
Mode: 1200 baud AX.25 packet

Sending Packets

According to the plan, each quadrant of the continent will take turns transmitting for 15-second periods of each minute as follows:

Northeast stations transmit for the first 15-second period of the minute (seconds 0 to 14), Southeast stations transmit for the second 15-second period of each minute (seconds 15 to 29), Southwest stations transmit for the third 15-second period of the minute (seconds 30 to 44), and Northwest stations transmit for the fourth 15-second period of each minute (seconds 45 to 60).

There are two ways to transmit your meteor scatter packets. Use the meteor scatter mode of APRS. This mode allows your computer to automatically send packets and plot received packets on a map.

The second way is to insert your grid square in the T0: address field of your TNC by using the UNPROTO command and then use the Converse Mode to send packets.

If you live in any area that straddles a quadrant, you must plan carefully and coordinate your transmissions with other local participants. Make plans not only to minimize interference to other locals, but to be sure that you are transmitting at a time when your

intended target is scheduled to listen.

By the way, only stations running at least 100 watts into a beam antenna should transmit. Anything less is unlikely to propagate packets via meteor scatter and just causes unnecessary QRM.

#### Receiving Packets

Even if your station is not a powerhouse, you can still participate by monitoring the test. If you are running APRS, each received grid square packet is plotted on a map and entered into the APRS Heard log. If you are not running APRS, I recommend setting the clock in your TNC and enabling the time-stamping function so that each monitored packet displays the date and time of its reception. This makes logging received packets easy and permits unattended monitoring and logging when you are unable to sit in front of your computer.

During the reception period, watch for stations sending packets containing grid squares. If you have a grid square map handy, make a note of the grid squares that are 500 to 1200 miles from your QTH and when you receive a grid square from one of those, you know you have hit pay dirt. If you are running 100 watts or more into a beam antenna, you can try and make a connection with that station, too!

#### Reporting Packets

After the test, send your reports contain the following information:

Your call sign  
Your state/province  
Your grid square  
Your effective radiated power (if you transmitted during the test)  
Call sign of received/connected station  
Grid square of received/connected station  
Time of reception/connection in UTC and number of received packets  
Mileage between your and received/connected station

Send your reports by mail to:

To: aprssig@tapr.org
Message-ID: <0d100030@acmspgw1.mnet.uswest.com>
Rendered body type: text/plain

Did anyone else try to run 74e DOZed in Windows during the MS test? I consistently get an error 5 bomb when the quadrant timer initiates a transmission in MS mode. Don't see the problem when NOT in Scatter, and I haven't done any research in Space to see if the same effect occurs.

Of course, I also managed to run the whole test period with the receiver volume turned down low enough to never even see local packets, so there is a SLIGHT possibility that there's a head space problem in the shack as well....

Oh, well. Only another eight and a half months till the Perseids.

Hi Bob,

I'm running 74C, and I thought I was going nuts. I travelled through all the heavy snow from north of Toronto to North Bay on Sunday (last) and noticed that I didn't keep the track. I'm now up to the 74E and will check closely today as I drive to work.

I'll let you know.

BTW you may want to add in your KPC file that if you change a KPC-3 from stand alone mode to HSP mode, that you must delete the the LTP fields, or it will continue to transmit the last value in the field. In my case, it was NO data, and I was transmitting commas. If the LTP values have old posits, you will keep transmitting them as well as the new beacon text.

It would be nice if the KPC-3 would only use these values if the INTF is set to GPS. Normal operation is when it is set to TERM. (Do you have contact with Katronics?)

cheers...mike

>between us, but can't seem to get reliable postings sent throughout
>our system. In other words, the well situated stations hear all of
>the juicy APRS stations from CT to MDC, but don't seem to send them
>to us "in the valley".

Pick the best "well situated station" and tell the TNC "MYA WIDE", or ALT-S,W from APRS. If this station can hear another WIDE digipeater directly, it might catch some of the stations using WIDE,WIDE on the first hop and digipeat the second hop to your valley stations. That's probably the best you can do until you get your mountaintop digipeater running.

This may also help the rest of us see your area as well. The users that can hit your temporary wide should set up an unproto path that uses the temp wide callsign as the first station, then WIDE,WIDE or even more non-generic digipeater callsigns to get your packets out of the Scranton area and into the rest of the NE network.

Good luck,

Jack

Hi Bob,

I drove to work with track history turned on (upper case LOG) running v74c and when I got here, I exited and checked the track sub-directory. There was no track history written.

I have noticed in the past that I have to do a File Save in order to get it to save. Is this working as designed?

(I forgot to take 74e out to the car, so the laptop was on an older version).

On the way home tonight, I will file/save first and then check it.

cheers...mike

APR REPLY: Yes, LOG ON only means that a TRACK HISTORY will be eventually saved once the 199 track memory FILLS UP. If it never fills on a short trip, then it will NOT automatically save. You must manually save. I CHECKED the code today, and LOG saving should be working as advertised.

It looks like I can say I have a working patch antenna that I can make in some Quantity. I have been using it on a Garmin 45 for several weeks and other than some freezing rain and snow falling at 10" per hour (not a typo), it is pretty reliable.

Coverage from Zenith to 45 degrees is excellent (better than the helix)
>From 45 degrees down to about 65 degrees is somewhat less than the helix that comes with the Garmin 45.
Near the horizon has very poor coverage.
It comes with 10ft of RG-58 (95% braid) and a BNC connector
It also has 4 3/4" magnets on the bottom.

I have materials to make about 20 or so. I'm still finding some suppliers for magnets, etc...

The cost will be \$30 US and \$5 for shipping and packing materials.
Shipments will be via Canadian Mail (this is the best way so we don't have any brokerage charges).

Payment is via money order or bank draft please in US\$.

(Canadians, please contact me directly for pricing).

I was just looking dreadfully at a directory full of 95 maps of the Madison
county Alabama area and the next task of looking at each map to extract the
center coordinates to enter into a maplist. Sure would be great if one of the
prorammmers out there in APRS land would write a little program that could
extract just the Map name and the 4th and 5th line and output this into the
format required by APRS as ALMAP1.MAP,4TH LINE,5TH LINE in ascii
format so it could then be pasted into a maplist. I find that the hardest part
of mapmaking.

420. APRS TRACK HISTORY

Rendered body type: text/plain

Aloha SIG, and to Bob/APR. Ref prob saving aero-mobile event track history. I DID have LOG on, to the best of my knowledge. I may have rebooted later in the day and didn't engage it. I've auto-saved and manually saved a couple other files since the flight and was able to replay those from the saved HST file (both auto-saved and File-Save routines). Don't know why the flight HST didn't save, and nobody else saved it either, so that one's lost. Guess we'll just have to do it again.

I liked the default LOG *on* better.

Enjoy the holidays. Aloha, Dave.

421. V# for N9VHW

Doug-
I am also a proud owner of an Eagle Accunav Sport which I bought nearly 2 years ago at a slightly higher price (ahem--\$470 back then) also from Pro Bass Shop. I am especially pleased with the high resolution graphic display which is better than the Garmins and Magellans. The only downside is battery life (roughly 2 hours on 6 alkalines) even at the low power setting. I also have good luck in my car where I mount it (w/ Velcro) to a modified metal bookend on my dash. For APRS work, I use a PacCom Tiny-2 coupled with a HTX-202 and have not had any problems. I agree that this unit has not gotten a lot of press probably because it is still more expensive than some of the \$250 units out on the market today. Glad to hear somebody else is using them---

Mike-

Unless you are a military user with a crypto-key and an authorized Precise Positioning Service (PPS) access, you will be denied positioning accuracy (using L1 and L2 signals) within 16 meters SEP. All other users (i.e. civilian) are afforded the Standard Positioning Service (SPS) which only receives the L1 signal (without ionospheric delay correction) at 1575 MHz. On top of this, the DOD has imposed Selective Availability (SA) which dithers the atomic clock reference timing and also the satellite ephemeris data. The upshot of all this is that standard civilian accuracy is purposely degraded to 100 meters horizontal accuracy, 2 sigma (i.e. 95% probability) and 168 meters vertical accuracy (also 2 sigma). It is therefore not surprising to be off by more than 500 feet in altitude at any one time. The SA imposed error slowly varies over time, so over a short term it may give fairly accurate DIFFERENCES in altitude rather than accurate absolute altitude. I hope this clarifies the situation---

Bill, the MKMAPLST.BAS program does just that! Bob included it into the APRS distro copy. Just put all your maps and MKMAPLST.BAS in an otherwise empty directory, and it does it for you.

Bob,

APRS Version 7.4e and several before it (c & d), do NOT work properly with the U-2000. The program crashes badly as soon as it receives data from the wx station. This happens from either the map or the P list.

Here is the info from the screen:

```
LM,PM: 0      0
a,I,J,K: 55  1  1 78
X,Y,X1,Y1 1102.345 98.53574 205.2888 16.40635
A$:
c$:
E$Finished DrwUnit
000PS! ERR number 6  Hit ENTER to return to DOS?
```

Below is a sample of the data sentence coming from the U-2000. The U-II works perfectly. Any suggestions (like I might be doing something stupid) or feed back is most welcome. I am in the DATA LOGGER MODE, by the way.

```
!!004CFFE70149000027FD02A8-----015C037B
!!004CFFE7014A000027FD02A8-----015C037B
!!004CFFE7014A000027FD02A8-----015C037B
!!004BFFDE014A000027FD02A8-----015C037B
!!004BFFDE014A000027FD02A8-----015C037B
!!004BFFDE014A000027FD02A8-----015C037B
!!0049FFE5014A000027FD02A8-----015C037B
!!0049FFE5014A000027FD02A8-----015C037B
!!0049FFE5014A000027FD02A8-----015C037B
!!0049FFE5014A000027FD02A8-----015C037B
!!0049FFE5014A000027FD02A8-----015C037B
!!0048FFE5014A000027FD02A8-----015C037B
!!0048FFE5014A000027FD02A8-----015C037B
```

It also appears that the initial attempt to grab wx data gathers corrupted data...I have seen the version 7.4c run for about 5 mins in the P list mode before crashing in the same manner. The extended running with 7.4c only happened once. The barometric pressure readings were correct with 7.4c during the one time it ran for several mins before crashing. I have no other accessories (no humidity, etc).

Hope this helps... and the U-2000 is AMAZING!!!!

WELCOME to the WORLD OF APRS, Bill. (hi hi) That program has been in every copy of APRS for the last year. It is called something like MAKELIST.bas I havent used it since the night I wrote it, so I dont remember the exact name, and I hope it still works. You will need to re-arrange the maps in your desired heirarchy, but it will build a MAPLIST...

429. MAPLISTS and Bill's challenge!

For someone that wants a nice little programming challenge, we need to take the code in MKMAPLIST.bas and modify it so that it not only scans all MAPS and builds a maplist,

BUT THAT IT BUILDS A CORRECT ONE!

This should be simple. Just scan through all the maps collecting their centers and their ranges. Then use some logic to sort them according to the following approximate rules:

1) Sort first alphabetically (this just sort of assures that when all else is taken into tconsideration, comparable maps of the same state will be in approximately the same place..

2) Bigger ranges first.

3) Any map that fits WITHIN another should come later. (Note, this includes both the CENTER location AND the range must be considered)

With a program like that EVERYONE, including BILL's life will be easier. It should be "simple" to do

430. SPRE Beacon with KPC-3

From: laborde@kilroy.jpl.nasa.gov (Gregory R. LaBorde)
Date: Fri, 15 Dec 1995 16:10:50 -0800
To: aprssig@tapr.org
Message-ID: <v01510101acf7baef5bfa@[128.149.100.84]>
Rendered body type: text/plain

My experience with my KPC-3 is that there is NO way to change the UNPROTO address from BEACON to _BEACONING._ Changing UNPROTO only works for "manual" [UI] packets. In other words, I can set:

Unproto DM04we v r0mir

If I type:

cmd:k
 blah blah blah blah blah

This gets transmitted:

KD6MSM>R0MIR>DM04WE: blah blah blah blah blah

However, if I let it beacon, I get:

KD6MSM>R0MIR>BEACON: Hi!

Can anyone way any different?

>You may be surprised at what you hear, if you can handle the withdrawal
>symptoms of NOT seeing all that other activity!

Here in NW OHIO, we are used to only seeing the same area locals, except for band openings. Without the ability to network into other populated areas, APRS can get boring. Consider yourselves lucky if you live in an area where the hams are willing to pitch in and/or open their wallets. I refuse to personally fund the two to four additional DIGIs needed to connect our area to more populated areas so it looks like it may not get done. Oh well, it makes for a convenient one line message drop for the area... {sigh}

432. APRtrak transmit rate

From: w5rkn@amsat.org (Ronald G. Parsons)
Date: Fri, 15 Dec 1995 21:04:14 -0600
To: aprssig@tapr.org
Message-ID: <v02130500acf7e3fe078b@[204.96.0.43]>
Rendered body type: text/plain

I timed the interval between transmissions of a packet by APRtrak after setting MODE-SPACE and POSrate to 30. The number to the left of SAT OVERLAY is 30/30.

The time between transmissions was: 9, 20, 38, 79, 98, 64, 320.

This is close to a doubling: 10, 20, 40, 80, 160, 320 if I ignore the 98.
So it appears APRtrak is working correctly

This time measurement was without any packets received from the digipeater.

With the duration of a shuttle pass being about 600 seconds, this gives very few packets during the "prime" part of the pass.

Is there a way to get APRtrak to beacon every, say, 30 seconds without using the manual XMIT key.

Rendered body type: text/plain

I just discovered the first AUTOWX program in the area... sort of by accident... I notice the new WX station out in the middle of the river. I been trying for a week to send him a message asking how he did that and never got any ACKS! I checked the HEARD log, and he was on the air...

Well, now I finally tracked him down and found that he was running the AUTOWX program. It apparently puts out an APRS WX report AS IF IT CAME FROM AN APRS station.

The problem is, that it begins its DATE-TIME-POSIT report with an @. And that means it is a full APRS station, capable of sending and receiving MESSAGES. That software should be using a "/" instead of a "@" so that everyone will know that it is NOT fully APRS compatible. I'm trying to get through to the author of AUTOWX to ask him to change that. Is anyone noticing any other things I should discuss with him?

P.S. He was in the middle of the river because he was using seconds instead of MINUTES for his posit....

APR REPLY: The POS-RATE command is a hold over from APRS and should be

removed from APRtrak. Your POSRATE will ALWAYS decay in APRtrak to minimize QRM, but there is a mitigating circumstance:

IN SPACE mode in APRtrak, your system is ARMED. This means that if it ever HEARS a packet from the SPACE digipeater, then your DECAY timer will be RESET to the minimum of 10 seconds again. This means you may have decayed to 15 minutes between your posits, but when the spacecraft comes overhead, BINGO you restart your POSIT.

CONVERSLY: Once your station SEES ITSELF, you are put into the "CONGRATULATIONS" mode and your decay timer will instantly go to over 9 minutes. No need to keep transmitting right?

You may force a POSIT at any time with the XMT-BEACON or XMT-POSIT command.

Also note that your station must hear a packet FROM the spacecraft CALLSIGN, not just a packet digipeated BY the spacecraft...

435. Paccomm HSP and Tiny 2 configuration assistance

From: jeff.wallach@drig.com (Jeff Wallach)
Date: Fri, 15 Dec 95 20:56:00 -0600
To: aprssig@tapr.org
Message-ID: <59.47110.99.0C38EB94@drig.com>
Rendered body type: text/plain

>From N5ITU, Dallas Remote Imaging Group:

Paccomm HSP Switch and Mode with APRS74E
=====

Here is an open question to anyone that may have the following configuration:

Paccomm Tiny-2 MK-2 with GPS EPROM dated 4/15/94

Paccomm Hardware Single Port Switch
APRS74E

I have setup the APRS74E for HSP mode
(after doing an ALT Save, it did as for registration number and also GPS registration number...hsp turned to HSP).

Connecting my Magellan 5000 DLX handheld to the serial port COM1 of which APRS is configured for, the NMEA 183D data streams in with no problem. doing an O C G , the GPS data can be logged to the NMEAlog and show my position.

Looking at the RS232 flow, the RTS, RD, CTS, and DTR showed active (toggling F8 HSP did indeed toggle the DTR line high and low)

However, if I hookup the Paccomm HSP cable (DB9 of Black cable to Magellan, Y portion of Gray cable to Paccomm Tiny2, and other end of grey cable to the RS232 PC cable), the RTS, CTS, and DTR show no voltage at all -- only the receive light is flashing once every 2 seconds to show the NMEA data is coming out of the GPS unit.

APRS tries to toggle between NMEA mode and TNC mode, with HSP port Time Outs...

If I go into Other COMM TNC mode, the unit usually locks up immediately...similarly, going into GPS mode it just sits there...no data show in the APRS application.

then it usually locks up the PC, and a re-boot is required.

There is 6 volts on Pin 6 of the DB9 RS232 connector on the Paccomm, so that should drive the transistor switch o.k.

Only thought may be the drive level of the Magellan 5000 DLX is too low.

Comments or similar observations would be appreciated.

436. Central and SW Florida APRS Finally!

From: n2czf@gate.net
Date: Fri, 15 Dec 1995 23:40:23 -0500
To: aprssig@tapr.org
Message-ID: <199512160440.XAA24508@osceola.gate.net>
Rendered body type: text/plain

I just wanted to comment that tonight I saw 4 stations from the central and SW portions of Florida for the first time. The Seabring area had 2 amateurs and I also saw another 2 in the Port Charlotte area. These are VERY important areas for APRS growth since they offer some very optimum networking capabilities. A solid East<->West link has not been established yet due to the 130+ mile distance and low population density of the area. In case of a major weather emergency where APRS can be of use this East-West link is vital since must of what hits one coast will very often cross the state and hit the other.

If anyone from the sig is from this area please contact me for further discussion about local activity.

Hi SIG, Scott here in Tahoe City
I'm wondering if anyone can tell me what I'm doing wrong?
It seems like just about every time I quit aprs to do something else like get E-Mail when I start aprs again I get an I/O Glitch.
seems like the TNC -a PICO 2 port w/internal GPS allways defaults to 9600 baud on port one and I've been configuring it 1200 baud for raido, 4800 baud for port one-the rs 232 port-and 4800 for port 2-the GPS port.
Can anyone tell me if it's ok to run the rs 232 port -1- at 9600 or what I'm doing wrong.
Thanks very much and 73 Scott

Bob...have you considered talking to your local emergency management about APRS? Get with your local EC and see about using APRS during emergency situations, then convince the government to buy the equipment for you under the auspices of RACES. Another option is to contact your local hospital administrator. Most hospitals have money set aside for emergency communications. Show them how APRS can be used to track disaster supply centers and distribution, as well as track field personnel. Then get them to buy the digi, transmitter, and put it on top of their building.

Just a couple of suggestions on how to get funded, good luck.

I was asked to post this msg for KA40PZ to the sig.

KA40PZ will be travelling APRS Mobile today from Fort Lauderdale to Atlanta via AIR MOBILE.

HE frequently flies around here in South FL and we have found that reliable connects occur as far away as 90 miles.

HE would like to invite anyone that see's him to connect to his TNC mailbox KA40PZ-2 and leave a brief msg.

There is a possiblilty that KC4NMY may be the callsign of the AIRMOBILE. So, if you see a plane on APRS in the Atlanta/FL region, try and give it a connect. 73 Mike KD4EMI

> is even close. (I CAN GUESS BASED ON THE MOBILES PLOT THAT
> IT IS OK THOUGH-But thats a hell of a way to verify it)

What you're seeing is normal operation for an L1-only, non-carrier-phase corrected receiver. The variability in altitude can be significant (I don't have ICD-GPS-200 at home and won't quote specs off the top of my head today...) but your long term average of altitude, using acceptable GDOP or VDOP values for the recorded fixes should be on the order of +/-5 meters (warning: Just finished Finals. Brain fogged)

In low dynamic states, with consumer-grade receivers using minimally acceptable algorithms, you're probably doing pretty well with horizontal accuracies. For my GPS-55AVD, in the airplane, I get reasonable coorelation with the altimeter. In the car, I can usually determine I'm somewhere in orbit about earth! The dynamics and the change in altitude inflight make a big change in dynamic (3-D) position accuracy.

> Can anyone tell me if it's ok to run the rs 232 port -1- at 9600

APR REPLY: Run APRS at 9600 is just fine. It only defaults to 4800
since many GPS units are stuck at that speed and sometimes people configure
their TNC's for 4800 to match when they go mobile as a
stand-alone-tracker.

APR RELY: Yes to the above. I gave it to AMSAT (my 2nd love) for
several reasons:

- 1) So they could sell it as a fund raiser for helping to build more
satellites
- 2) So that I had no monetary interest in it and then could PREACH about how
good I think APRS would be for SAREX and other "wide reaching, low tech"
satellites for school, students and kids and us old fudds too...
- 3) So that I could add neat little space things to the APRS code without
taking up space and bloating the normal APRS...

APRS itself still has the space mode, but does not have the special "ONE
TIME" code necessary to receive the telemetry and special formats from
the 24 hour mission of the SPRE experiment coming up in 4 weeks...

Register APRtrak with AMSAT....

On Sat, 16 Dec 1995, someone wrote:

> What is the proper format for stationary stations who wish to go through
> a local gate to be visible elsewhere?

APR REPLY: Sorry, but the proper procedure is to buy an HF radio and put
it on 10.151. That way your station can *hear* the already busy channel
and it will only inject a packet when the channel is clear. And it will
also use a transmit timing that is appropriate for the much slower 300

baud channel.

Unless you are a special event station, or a mobile involved in some event or exercise that is of "national" interest, then your VHF packets are not really appropriate on the SINGLE SLOW 300 baud channel. This is *not* to say that most of what you may see on HF necessarily *is* of national significance either, but simply that the VHF user is BLIND to the congestion on the HF side of the GATE and like anywhere else in Ham radio, SHOULD NOT TRANSMIT WITHOUT LISTENING TO THE CHANNEL... Or another way of saying it is that ONE VHF station anywhere within range of any number of dozens of gateways can pump so much 1200 baud traffic into the narrow 300 baud gate that it would totally QRM the HF net into grilock nationwide.

So this HF restriction is not an elitest stance, but simply a protection of the vary vulnerable 300 baud channel (more like 50 baud throughput) from the estimated 1000*1200 baud potential of all the VHFers that would like to use it...

See README\HF.txt

Please do not use GATE or GATE,GATE on VHF...

Greetings APRSers,

On the subject of GPS position and altitude accuracy, one might summarize generally as follows. Note that these are generalizations, not intended to be technically detailed.

Note also that I am _not_ discussing the use of DGPS corrections to improve accuracy

Nice reply by Mike KA6SPT. I agree completely. You can't dispute the facts. Also, the Eagle Accunav is reputed to be very good, especially under forest cover.

1 - Altitude accuracy is always about 50% worse than positional accuracy.

This has to do largely with all the satellites being over your head. If there were visible satellites both above you and below you, then the triangulation would yield better altitude accuracy. Unfortunately, our planet gets in the way of that. I never pay any attention to the altitude readout. It has very limited value.

2 - Positional accuracy errors can be as big as +/- 150 meters. Position errors are less than 100 meters (330 feet) about 80% of the time. Let's not quibble about the exact percentages.

3 - Two GPS receivers side-by-side can give completely different position and altitude readouts, for at least two reasons. One, they may be tracking different satellites. Two, if the GPS engines are of different makes, they may use completely different algorithms for computing the position (i.e. single channel sequential tracking, versus parallel channel simultaneous tracking).

4 - The position and altitude errors are due in part to the Selective Availability (SA) "feature" provided by our government. SA causes the satellites to dilute the accuracy they would otherwise provide.

In summary, if you look at a NON-DGPS receiver, and it is reporting a position error of less than 50 feet, you're simply lucky. Keep watching, and the error will gradually increase, then decrease, then increase, in the never-ending dance of SA.

Thanks for listening. Happy tracking,

Tom - Salem, OR [turnstone@aol.com] AB7NV (ex-KC7AGK)

Message-ID: <199512171349.IAA10505@gold.interlog.com>
Rendered body type: text/plain

Hi Bob,

It would be nice if when we exit from APRS with the laptop that the restore.tnc file sets up all the buffers for the KPC-3 to track in standalone mode. (not a problem, we can do this now, just modify restore.tnc).

Now, when I start APRS, what file can I modify to take my KPC-3 out of standalone tracker mode and reset all the LTP values to null? Is there an INIT.TNC??

I often change from from HSP mode to standalone tracker mode and this would help to automate a little better.

Seasons Greetings....mike

David W. Barrow III sez:

>
> Re: induced error
> Personally I think this induced error is "for the birds". Any
> need that might have existed is now gone. Maybe I'll just go to
> LoranC.

The errors involved in the GPS system are of two forms: Induced and Common Mode. Common Mode errors are those inherent to the system design, and seen by everyone. These include minor (read, "minute") changes in orbital parameters that are not accounted for in the Ephemeris data, Single Event Upset errors induced onboard the spacecraft that are self-correcting and transient in nature, multipath error, caused when the signal is received from several reflections, and with associated temporal delay, and atmospheric delay induced by the signal's traverse of the atmosphere, primarily the ionosphere, with a modellable but variable delay value. Longer epoch times and reduced chip count also fall into this category.

Induced errors are those that were designed within the system to provide a level of security to the system and its primary intended users: The US Military. These systems include diddling the PRN's output time signal (not the onboard standard) as well as misreporting ephemeris data slightly. The system is designed so that introduction of SA errors can be modulated depending on the subsatellite point (and obviously, the visibility window) of the PRN. So, it's conceivable that PRN16 might be diddled over, say, Bosnia, but not the Pacific and the US. Or, they might just decide to report PRN 12 as available and healthy over Paris, in honor of the strikes:-)

As to whether the introduction of SA error is necessary any longer, I won't argue. I've my own opinions, and they just may differ from yours. I have been utilizing a DGPS system here (fabricated from stone knives, bear skins and a motorola VP OnCore board) that provides me reproducible 3 meter accuracies with L1 only receivers. What can I say?

Rendered body type: text/plain

Sometimes while running APRS, my call sign changes all by itself. I suddenly BECOME some other station from my P-list. The only apparent way to get myself back is to leave APRS and start it up again. This may happen several times in one day and then not again for a week.

We want to tell Bob Bruninga about the problem but can't seem to force it to happen so there isn't enough info for him to work with. I know of 2 other people who have had the same thing happen.

It has happened with more than one version (7.2b & 7.3a) All of the us have been registered users running weather with U-II. TNCs have been both KPC3 and PK-88. It MAY be happening as we enter or leave the TNC mode with O-C-T but as I said, I'm unable to make it happen.

It's wierd (disconcerting, too) to all of a sudden have your call sign change. Has this happened to any of the rest of you??

468. PicoPacket and APRS 74e

From: gwyn@paccomm.com (Gwyn Reedy, W1BEL)
Date: Sun, 17 Dec 95 15:13:59 UTC
To: aprssig@tapr.org
Message-ID: <12219@paccomm.com>
Rendered body type: text/plain

On Tue, 12 Dec 1995, Randy Hall wrote:

>Does APRS74e.zip address the picopacket issues:

Thought I'd publish the information on this interface on the SIG.

This information relates to PicoPacket EPROM dated 12/10/95. Earlier versions may not have the same capabilities.

This applies to a PicoPacket 2 port model with a GPS attached to the 2nd serial port, and also to a PicoPacket with a built-in GPS receiver (which is attached internally to the 2nd serial port).

There are two ways to set up a Pico to interface with APRS without using a port switch cable.

1) Set the LOC command to 'beacon' your GPS string periodically. Perhaps once per minute - user's call as to how often.

```
GPSTEXT $GPGGA (default)
LOC E 6 (once per minute)
ELOC ON
```

The ELOC converts the 'beacon' of Location from the HDLC (radio) port to the terminal serial port. So the Pico 'beacons' and ASCII GPS string out the serial port each minute.

If you later turn ELOC OFF, location beacons will resume on the radio port.

The ELOC technique is also useful for other than APRS applications.

2) Second method: This method will automatically change the PICO from a trakker (location transmitting device) to an APRS TNC.

```
Set the location beacon parameters you want for the TRAKKER:
GPSTEXT $Gxxxx (select GPS string)
LPATH to via path (typically APRS v relay, wide or such)
LOC E 6 (beacon once per minute - you decide how often)
```

This will cause the Pico to beacon its position whenever there is no APRS computer hooked up.

As soon as you hook up a computer running APRS (which was initialized with the command PICO - see Bob's docs) the following happens:

APRS sends out a CTRL-E to the Pico.
The Pico responds with an ASCII beacon of the selected GPS string AND the Pico Location beacon timer is reset to zero.

Whenever APRS wants an update to the fix, it sends a CTRL-E and the Pico

sends the data. Works like the hardware port switch, but it is all done in software. As long as APRS asks for a fix more frequently than the LOC E nn timer is set for, the PICO never beacons.

As soon as you unplug the computer (or stop APRS) the Pico resumes its position beacons.

I've had that happen to me too, but very infrequently, i.e. less than once a month. My station runs APRS 24 hrs a day on VHF with U-II and a KAM. It has happened to me while I was away from the keyboard, so I don't think it has anything to do with O-C-T use as you mentioned. But I haven't found any other clues as to what might be the cause.

I am having trouble accessing ftp://tapr.org/tapr/SIG/aprssi/upload when using the Microsoft Internet Exploror (release version) and Windows95, when in the "Favorite Links" area. Has anyone else had this

problem, and if so what did you do to fix it???

I did not have this problem in the Beta version. (It wasn't broken so MS had to fix it)!

I have not had any problems with Netscape v. 2.0. Its' "Bookmarks" work every time. Maybe I should just kiss off Billy Gates and his attempt to enter the world of Cyber Space???

Thanks for any ideas.

> LoranC.

APR REPLY: A decent percentage of the people on this net could probably get together, and with less than the investment it takes to buy a new car, could build a CRUISE MISSILE using GPS to target any spot on the surface of the earth. I personally am thankful that the government is providing some protection for us in the form of SA.

When you consider the resources and money available to the crazies in the middle east, the individual making the above statement is "misinformed".

His reply will be that what difference does 50 meters mean when you deliver a bomb? Again, he is misinformed. The 100 meter randomness is only the RESULT of SA as seen in POSITS. The real effect of SA is in the velocity component which, when you are cruising at several hundred miles per hour even the slightest errors will make you miss your target by A LOT MORE THAN 100 meters.

Be thankful that we civilians get to play with these high tech toys in a free and open society. Which a lot of folks would like to destroy...

I donno what this has to do with APRS, but sometimes I get a little patriotic...

APR REPLY: Very disconcerting, but I can't find the problem in the code... I haven't seen it in over 2 years.... but we have to trap this gremlin in a reproducible way... So when you see it happen to you, figure out what may be unique about your station or the NET and feedback to me...

>

>Jim, N4PUQ

>

>suddenly BECOME some other station from my P-list.

Well, Jim, somebody's punishing a lot of us...

It happened to me with the following situation:

- 1 KPC-3 w/ U-II running 24hr.
- 2 Remote connect to WA9CJN wide to change parameters
- 3 I think CJN heard a station, then mine took on that station's
callsign.

It only happened once under those conditions.

Also, can somebody tell me why my computer/APRS/U-II will go into the UNPROTO screen overnight when I set the Screensaver function on. Often when that happens, the buffer starts filling. The screen quits updating til I attend to it, then the buffer dumps into the P-list.

Oh, the bandpass filter continues to crank along great. Best \$89 I've spent on this APRS system.

Can anyone tell me the incantations required in order to enable tracking of a mobile station in APRS? I have been listening on .79 for about a week, but have not heard (seen?) a soul. Things are rather quiet in the Denver area. Consequently, I have constructed a mobile station using a Magellan Trailblazer XL, TRS80 model 102 as NMEA NC and Icom P2AT radio. It all works fine, and the message it sends looks just like the description in "Protocols.TXT" for a mobile. I can adjust the rate to whatever I like, or send an averaged position fix. It all appears at the bottom of the APRS74e screen, but I can't seem to find the magic sequence of keystrokes to get it displayed on the screen!

I have pored over the so-called documentation, but there is nothing in the way of a tutorial on tracking. I went through all the menu commands by letter, but nothing looks likely. What am I doing wrong? Also, what does the "Channel Loading" number at the bottom right mean? Mine frequently reads numbers in the 200-300% range when monitoring a channel that sounds about 10% full!

Gratefull for any pointers!

Me Too!! I seem to become someone else sometimes, as well. I am running a U-II and have had this problem in *at least* all of version 74. It may have something to do with when I "hook" another station and leave it hooked. I think that is the station I become. The only way I can fix it is to restart with a virgin config file.

At 02:19 PM 12/17/95 -0600, you wrote:

That reminds me of something I saw in Dallas last week that I just had to laugh at.

I went to Tucker Electronics. Their bandpass filter is 59.00 or so and is very small (about 2"x3")
It has a power lead on it. The salesman (and also a different person on a different day) told me "it works great, you never hear any intermod".

No wonder! The thing has 6 db of insertion loss! They do not print the specs, but both salesmen told me this. How do you transmit after you have inserted a device that halves your power twice? The power lead on it is to power a Tx/RX (pin diode?) switch so you can pass 50 W thru it.

Let's all go buy something that cuts our receiver sensitivity in half twice so we don't hear intermod. Sure hope your digis and repeaters are REAL close, and forget about simplex.

OK, now I am beginning to understand, I may have some fine tuning of the U-2000 to go yet. Sending this to the SIG too so that anyone else that is having problems with my interface to the U-2000 can all reply at once..

NOTE TO THE SIG: Remember that there are dozens of messages here every day and I can not keep in my mind any on-going dialog with each individual, although i recognize most of you well, I just cant keep it all straiight, hi hi. So each time you report a problem, you have got to put it ALL in that one message. Each follow up message on the same subject should not assume that I remember much if any from the previous

message... hi hi

It sounds like you are doing it the hardway... Do you mean you are using
the 102 to parse and BUILD an APRS position packet?

If so, then here is what it should look like as a standard packet
monitored on any TNC or the APRS bottom line:

W3XYZ>APRS,DIGI:@DDHMM/3859.11N/10504.44W.....

Everything after the W is optional
The packet and HEADER must be on the same line.
When APRS displays this on the bottom line, it also shows WHAT IT DID
WITH IT. If it says POS..... the it was interpreted as a POS.
If it says BCN, then it was NOT a pos and was placed on the LATEST list.

If it was your own packet it says MY.....
if it has no header then it says NO>
etc...

But you dont need the 102 if you use a new TNC that will just transmit the
RAW NMEA strings at a much slower rate. APRS parses the raw NMEA right
off the air...

Hope this helps... OH, be sure that you are not using the SAME call for
your mobile and APRS. (different SSID's are OK) Otherwise it is ignoring
"itself" and thats why its not putting you on the map...

You know it would be just great if somebody that's well versed on the subject
of hooking up WX,GPS,TNC;s etc would come up with a list on how to do's.
I see so many messages how do you hook this up and how do you hook that
up. I have one right now. SINce ny WX station got hit by lightning and is now
fixed but was running on an old 8088 IBM. I now want to setup a standalone
weather station using a TNC, Radio only. I can use a KPC3,Tiny-2,DRSI DPK2
but would like to know the whole setup, and yes i know there's something
about this in the doc's, but there are many of us that are good at one thing
but not another. Boy that would sure solve a lot of problems users have that
i see questions about. I would like to make another GPS tracker but don't
want to go through all that stuff (Had a better word for stuff but didn't want to
use it hi) i went through with the Magellan NAV5000DX and the KPC3. So it
would really be great for all users to be able to download a file from Tapr on
HOW TO HOOKUP and PROGRAM ur TNC etc. Just an idea fellows. All i see
all the time is a buch of gobblegook and technical terms that an old man like
me just doesn't even want to read hi. Go ahead with the flame throwers again
i just bought a fireproof suit har har.

>HELP [APRS74C With ULTIMETER 2000 and AEA PK12] CAN'T GET IT TO WORK

APRS does not currently support the U-2000. It has some bugs. Bob has been informed of the over run problem and is working on it.

Further...your message for help is nearly worthless...what doesn't work? How doesn't it work? Can't get it to work tells us next to nothing. If you want help, be more specific and many of us would try. I have a U-2000 running right now, but since APRS is experiencing overruns, I am not running APRS as of two days ago.

My theory is that the data output from the U-2000 is so much more intensive (at 90 data sentences per minute), compared to the U-II (at about 17 per minute), that Bob's program can't hack it until he makes some modifications.

Will keep the sig informed, if Bob makes some progress (as I am sure he will, as well.)

I haven't seen it on my WX station, but it has popped up once or twice in
the car with HSP. Every once in a great while, my call will pop up in the
P-list with one extra character.

>happen several times in one day and then not again for a week.

Yes this has happened to me where I will get a -X, where I had a -nothing,
or an extra letter thrown in towards the beginning of my call. Many times I
can hook it and delete it. Sometimes not. Not enough data to discern between
operator error and system bug....

Paul, WD9ABE

1) The problem of "stolen calls" was when your station would acquire some
one else's callsign for itself and place it in the 1st position of the P-LIST.

I found a quaint set of circumstances that could cause this to happen...
it will be fixed in the next version.

2) I have hooked my U-2000 back up and it seems to run fine. Would those stations having problems, set your WX update rate at something short like 8 seconds and then comment on any changes in the observed symptoms relative to what you were experiencing before? Thanks...

Jack- That is a different problem. Bob says the problem you are seeing
(and it happens *a lot* with my HSP- I think because I have a very fast GPS
screen update posrate) is from garbage being received during/after the
switch from tnc to gps and back. I usually have 5 or 6 bogus mutations of
calls on my p list until I delete them

499. Previous call for help

From: gwelte@blueox.bji.net (George A. Welte)
Date: Mon, 18 Dec 1995 12:10:57 -0600
To: aprssig@tapr.org
Message-ID: <v01530500acfb051b79ef@[206.31.226.34]>
Rendered body type: text/plain

Agreed, mu previous call for help was very generic but it was my first time
on line with tapr.org and I didn't know what to expect. I am, however very
pleased with the response.

Realizing the U-2000 is not operating properly with the APRS74e program I
still must be doing something wrong since my station does not even come up
on the map (discounting the weather). Listed below are the commands I put
into the TNC for a remote weather station operation. I will try the single
port mode later.

Echo "Off"
Flow "Off"
Ilfpack "On" (LFIgnore)
CPactime "On"
SENDPAC "\$01"
Conmode "CONVERSE"

My "N0WBU-1"
UN APRS VIA RELAY
GLOCTX "60"
BT @ 230911/4733.30N/09452.59W_Bemidji Weather
Beacon E 60
GNMEA1 \$ULTW
TBAUD "2400"
RESTART
"Then I was putting in GPSMode 2, but now I understand that shouldn't be done".
"I then turn off the TNC and plug in the U-2000 with the green wire going
to pin 2 on the TNC and the black wire going to pin 1 or ground. The
U-2000 mode is programmed to the packet mode. (clear with wind chill)

I have tried many alternatives but to no avail.
I am using an AEA Pk-12 along with the U-2000

Any help will be appreciated - then I'll worry about the 2000 when Bob gets
it working.
Good work everyone and Thanks.

I kind of wrote it off as an RS-232 glitch. There's a lot of data flying
around on that interface when HSP is running.

It would be interesting to survey the folks experiencing the problem to
determine a few facts about the hardware they are running - i.e., CPU type
and speed, and type of UART on the serial interface. It would not surprise
me if we see a correlation with the problem and the use of 16450 or 8250 UART
chips.

Rendered body type: text/plain

I have had this "new callsign" problem many times when I leave APRS with the
O-C-T operation.

This has also happened when someone connected to my station with a normal
packet connect.

I have watched the program change back to the APRS screen from the blue
screen many times. It looks like, if my system gets position information
from someone else at the time of changeover, it will grab that information,
not my information.

I have never seen this happen with my PK-232 or my KPC-3, just my KAM.

My Gate set-up:

XT computer w/VGA
Older KAM on com 1
WX station on com 2
Kenwood VHF rig
Yaesu HF rig

Bob once said to make sure I was in the cmd: mode before going back into APRS, but it didn't work. Is it just a KAM problem?

>

Would this be possible? Sure..

Will it work now??? NO...

The problem is that the data that gets sent via the SERIAL PORT is only the DATA part of the packet, i.e.

@181200/4012.34N/07412.34W Metc etc etc

The part that the program expects to see is:

WU2Z*>APRS:<the same as above)

The call sign and TO field (APRS) get added by the TNC, and this would not be present if you simply hooked the serial ports to a pair of modems..

For it to be possible, we (Bob and I) would have to write a NEW mode, and it probably wouldn't be worth it..

You could however, dump P-Lists, and send them over a modem, and load them in at the other end..

Hate to be the bearer of bad news, but it has happened to me on at least one occasion and I do not have a wx station.

I'm running 7.4e, and an AEA 232 (old(no mailbox etc)) multitasking from Windows.

I think I had switched back to Windows (3.11), done some things and switched back to APRS and there I was, someone else!!! I had attributed it to the large P-list (about 5 pages) but that was a guess.

I also get some other Call sign changes that show up as Wi4XXX with the lower case i instead of the correct call.

In either case, I can hook my or the other call, delete it and under it is the correct Call.

For whatever this is worth!

Ah, but, what I want to do is to use a machine with two serial ports. Com1 hooked to the TNC and Com2 hooked to the modem. The computer just repeats what it hears on the TNC over the modem. The computer with the TNC doesn't even need to run APRS, but the computer on the other side of the telephone line would be running APRS without a TNC.

This is just an extension of Bob's op-center idea, but using modems in lieu of serial lines.

Another idea would be to define a viewer for APRS data and use the World Wide Web for distro. The viewer would first check your local system for the appropriate map, and if it isn't there, download it. It would then update position information as it is received. Just an idea. The actual implementation would probably be too slow for practical application.

Right on Bob! Some may forget that NAVStar was built as a military system for weapons delivery and navigation. We really are fortunate to be able to play around with our trivial little toys on a system that is literally out of this world. Keep up the good work with APRS. (But we really don't need the version of the week, Bob. HI.)

This is news to me! December or January issue of QST, I thought I looked over all the ads but I saw nothing about APRS and Windows.

I did see a full page ad for Health Insurance in the January issue and was shocked! I E-Mailed the ARRL and the Advertising department and told them how inappropriate I thought this was, anyone else feels this way tell them also at gst@arrl.org!

Well after reading all the mail on APRS over LL BBS's that reminded me that Bob was working on such a feature quite a while back. I think that this past year has seen such a tremendous increase in internet that the LL BBS idea may be better made into a INTERNET process.

Packet<->Internet Gateways are already a common thing in many areas of the world so the APRS<->Internet idea should not be that big of a thing to accomplish by a well versed person. With the Internet packet Chat channels I believe that a dedicated system is needed, that is a luxury that many do not have unless their company is willing to donate some bandwidth to the "cause". The best way would be to have the ability to do it with a regular PPP account that many of us already have. For a few extra \$\$\$ many providers will allow unlimited access and many users already have a extra phone line and PC to get the job done.

Internet Phone is a great way to link distant repeaters with simple equipment and I have done this several times but we are talking a different bandwidth here

I know of one person that is on the sig and is probably reading this that can do this in the blink of an eye. He is the smartest person of the land <grin> and a internet-ip-aprs-packet-software...etc.etc. guru! He knows who he is maybe in the future this can become a reality.

518. GPS-45 Auto Shut Off

While driving to work today, with my standalone tracker running, I noticed that my GPS-45 kept turning itself off. I thought it might be due to the transmitter, but still did it when the radio was turned off. I thought that maybe the pico was sending in the OFF command, but turned off the pico, and the GPS still turned itself off.

I thought I heard about some weird low battery problem with the GPS-45 that even with external power applied, that it would turned itself off.

523. AEA PK232

From: Penn M McClatchey <pmm@safn2.saf.com>
Date: Mon, 18 Dec 95 20:07:11 EST
To: aprssig@tapr.org
Message-ID: <9512182007.aa00348@safn8.saf.com>
Rendered body type: text/plain

I hope I'm not asking a stupid question. Probably am, but here goes. I've been using APRS for about two weeks. I put my registration form in the mail Saturday. Everything works great on VHF. On HF, everything seemed to work well on Saturday the first time I ran it. I was xmitting packets. Yesterday and today, I can get it to receive fine, but not to xmit. APRS tries to make the TNC xmit, but it won't. When I go to View screen, it looks like APRS is sending an error message "too many packets outstanding" to the TNC. It is possible that this is an AEA error message, though I've never seen it before. With I try to talk directly to the TNC in APRS using O-C-T, I can't get the TNC to give me the error message, so I'm thinking it is generated by APRS.

Now for something strange: when I go into Pactor (using different

software but the same TNC) and send something, it prefates my xmission with the APRS packets I would've expected to send under APRS. So APRS isn't getting the AEA to transmit its buffer, I guess?

I am not using a GPS. I am simply running APRS though COM1. I have also tried initializing the TNC and then running Alt-S-T to initialize everything, but nothing seems to help.
Any ideas/suggestions would be very much appreciated.

BTW, I ran the meteor scatter routine last Thursday evening.

No way could you send TNC audio data using Iphone, the distortion and timing problems would make it impossible. Plus the Internet bandwidth (about 4k byte a sec) used by Iphone would be wasted on a 1200 baud datalink. It would, however, be fairly simple for Keith to add Winsock support to the Windoze version. This would allow both Internet and LAN sharing of APRS data. (The new Winsock specs call for Winsock to become the standard network interface for everything from TCP/IP to Netware). It would be kinda neat for someone like me (who lives in an area with almost no APRS activity) to be able to log onto a radio/internet gateway server and see activity from several nets around the country.

Sort of a high-bandwidth version of HF? :-)

Possibly something based on IRC (RFC 1459) would be good ... it's a well-used distributed platform mostly used for chat, but it could be used for APRS too. It's fast ("slow" is considered 3 seconds from, say, michigan to australia), high-bandwidth, easy to code for, etc.

If you'd like to go this route, give me a shout. Would fit in nicely with an X version of APRS, yaknow? ;-)

>>
```

To the fellow wiring a U-2000 to a TNC... pin 1 is FRAME GROUND.
Try Pin 7 - SIGNAL GROUND and see what effect that has.

Also, try feeding the data output from the U-2000 into a dumb terminal or
a PC running ProComm or TELIX or some such plain vanilla comm prog.
Determine whether your Wx sta is putting out data with that cable.

Test each of the pie pieces separately!

APR REPLY: That was on my to-do list, until I got to thinking that the
WWW and the internet would be a better way... but I dont have a clue how
to write drivers for the internet... so now that Keith and Mark have
taken up the leading edge, maybe I can get back to the phone line thing...

But That requires SOMEONE in each region to BUY and maintain a phone line
for downloads... Is that worth it? Will anyone do it?

The way it would work, is that you bring up APRS. Tell it the phone
number you want it to dial. It dials the remote APRS site, gets a dump
of all the P,L lists, etc and then hangs up. You will not be allowed to
inject data into the remote APRS, but you will be updated as if you were
there! After the phone dial goes through, the whole thing should take
about 10 seconds...

Only the class of license for the frequency you are transmitting on.
If you can talk on 2 meters, then it is fine to GATE from HF to VHF *one way*

If you can talk on 30 meters, you can do it the other way, too.

Bob, WB4APR
Keith, WU2Z

Regarding CommBufferOverflows with the U-2000

Bob, you suggested setting the AltS-PosRate to 8 seconds in an effort, I think, for APRS to go get the string from the U-2000 before it could fill up the CommBuffer. That reduced the Overflow here but did not eliminate it, so I set the rate for 5-seconds and I've been running for over an hour with NO OVERFLOW.

Initially, and at times, I see a "cmd:" line with some TNC parms slip out onto the air but these are soon "overbeaconed" by the next Posit or "regular" beacon... is this the bug that was reported to you guys besides the overflow problem?

Just to let you know about the 8 vs 5 second "sampling" rate...

Ok guys, the third iteration:

1. Tried setting Wx update to 8 seconds. It helped, but crashed within 5 min
2. Tried setting Wx update to 5 seconds. Crashed after about 30 min
3. Just set Wx update to 3 seconds...more info later.

Bob: if you see this, it looks like you might have to re-code this. I don't know what kind of overhead price we are paying for trying to update every 3 seconds...and also don't know if it is going to eventually crash as in 1 and 2 above. Hope this helps. 73,

robert "hasan" schiers

Correction: I got a crash, overrun type after about 10 mins of running. I have changed the updates to 5 seconds to see if that helps.

Changing from the program's default to 8 seconds appears to work...at least

so far. I am no longer getting the crashes that plagued me earlier and the only thing I changed was according to Bob's instructions as above.

Congrats Bob!

I have not started the program from scratch yet, to see if there are initialization problems, but simply re-registering the software and setting Wx update to 8 seconds solved the problem so far.

Thanks for giving us the hint, Bob. Looks like something that should go into the docs somewhere <g>...73,

8 seconds produced a crash after about 10 mins running. Much improved, but still no cigar. I just changed the Wx update to 5 seconds and will watch it some more.

Incidentally, those of you with Ultimeter 2000 units who want to convert from inches of mercury (which is the typical unit of measure on TV and National Wx Service) to millibars, here is the formula:

Inches of Mercury * 33.86 = millibars of mercury

So if your U-2000 is set for in of mercury, you can check your APRS for a reading in millibars.

Currently my pressure is 30.13 in of mercury (Hg).
 $30.13 * 33.86 = 1020$ millibars. APRS is showing /B020 in the wx string, which corresponds to 1020 mB. If the pressure falls below 1000 mB, I suspect the leading 0 would become a leading 9.

Have fun...

IRC would probably be ideal. The interconnected servers already exist. Adding an APRS channel wouldn't be a problem. It would be unfortunate to leave the DOS people out of the game but it would solve the limited

bandwidth available on HF for wide area networks.

Plus with the software interfacing to the internet Bob's idea of using the APRS query command to allow you to lookup someone by call and then display their QTH in APRS could be easily added by linking into on-line callsign databases.

I may be way out in left field.....but if you had a way to hook the modem directly to the tnc
and then get the modem to only connect you to the TNC after a password.....then in effect aprs
could talk to that TNC as though it was connected to it. Thats kinda how the packet worm
holes used to work.

Just an idea to think about.

Are you using a cable you made up, or is this the cable from PEET Brothers?
Since the Pins are different on DB-9 and DB-25 cables I will not guess if your
pinout is correct. My guess would be that you need to switch pin 2 and 3
around. Remeber you are plugging a modem into another modem, thus to connect
them using a cable wired to be plugged into a computer you will either have to
use a null modem cable or switch pins 2 & 3.

Hope this helps and 73

On Mon, 18 Dec 1995, Jerry wrote:

> I think that novices and tech cannot be a GATE transmitter on 30
> meters, at least not for long! *>).

This is true. Since Novice nor Tech stations have privledges on 30
meters, they can't be a gate but there is nothing that says they cannot
(ie its not illegal) to uplink via a gate operator who is general or above.

It is the gate station transmitter who is legally transmitting on 30
meters. It is no different than a tech talking on a 3 band repeater,
with one band being a ten meter repeater. If they are transmitting on a
frequency that they have privledges, it doesn't matter that the signal is
being retransmitted on another band they do not have privledges on. The
transmitter at the gateway identifies itself.

Yes there may be confusion on the fact that some 00 might look up a call of someone who they see on 30 meter packet who is not licensed but further research would show a path of ...gate,gate.

If the 00 isn't APRS literate they might not understand this though.

What is the different with that or a novice connecting to a packet network on a node on 222 Mhz? Absolutely nothing.

'Specially for Bob & Keith
But For the SIG too...

Setting the POSRate for the 5-seconds works ok if NOTHING else is fiddled with. If you don't touch the keyboard, APRS will sample the COM2: port (in my case), get the U-2000 weather and return to monitoring the frequency.

Touch the keyboard, however, as I wanted to input the snow symbol, and lockup... Comm-buffer-overflow and you have to CTRL-ALT-DEL the computer. This was running on a 286 by the way... not my 486/66 so maybe the faster CPU would not let the buffers overflow, but then maybe it would!

I can unplug the DB-25 connector on the COM2: port and it will "empty out"... sometimes, but redrawing the map is slow enough on the 286 to cause it to lock up again...

So, I guess there really is a problem after all... faster wx station output... more data to parse... hmmm!

Sounds like your threshold setting is too low. Turn it up a little
so the little LED next to it isn't on when the HF freq. is clear. The
TNC won't transmit if that LED is on (i.e., the threshold is too low).
Perhaps the knob got adjusted since the last time you ran packet (or
APRS) on HF, where the noise level is usually higher than VHF/UHF.

> Now for something strange: when I go into Pactor (using different
> software but the same TNC) and send something, it prefices my
> xmission with the APRS packets I would've expected to send under
> APRS. So APRS isn't getting the AEA to transmit its buffer,
> I guess?

The TNC can probably hold 7 or so packets (might depend on your MAXFRAME
setting???). After that, if those packets can't be sent, you'll get
"too many packets outstanding." But those packets will stay in your
TNC's xmit buffer, and when you switch modes with the PK-232, whether it
be to PacTor or CW or whatever, that buffered APRS data will go out.

Hope this helps.

I've experienced it with a laptop that has the 16550 UART, I use the HSP
cable and both the tiny-2 and the pico TNC's I don't think it's occurred with
the pico; I'll be more observant there; the pico has the built in second
serial port for the GPS, whereas the tiny-2 is using the HSP cable.

What? A backyard cruise missile? I think someone is missing the point for a number of reasons.

a. Someone having the technology to develop and build a cruise missile being able to target 'any spot on surface' would not rely on a \$300 Garmin to do the navigation. They surely also would have the technology to 'break' the code used for SA. Maybe they would not go for Navstar/GPS at all, they could easily choose to use GLOSNAS instead.

b. As seen during the Desert Storm the terrorist weapons used was not locally developed, but slightly modified Russian designed SCUD missiles. This leads me to believe that even governments which spend large amounts of money on weapons would try to buy, steal or borrow these items than design and build them. I do not know the cost of the development of the tomahawk missile, but I believe this would be above the capability of an average Middle East government.

c. Terrorist whether groups or governments are not requiring pinpoint accuracy, they want publicity. That means that a car bomb at downtown McDonnals are a lot more useful to them than the ability to deliver a charge at SAC's backdoor in Colorado Springs. This has been proven for a number of years in Europe (Paris, Baskerland, Germany, Northern Ireland etc.) and in the Middle East (Israel, Lebanon, Egypt etc.).

> Be thankful that we civilians get to play with these high tech toys in a
> free and open society. Which a lot of folks would like to destroy...

I am quite sure that your government had some bigger views than high tech toys when they forced the military to make GPS available to the public. :-)

Another stupid question! Why cannot one simply refer to the nearest point of known coordinates and height, determine the instantaneous error between the known coordinates and GPS results and correct for it? Or is the SA implementation really more complex than that?

Could be. But, contrary to popular belief, "military" versions of GPS are available to the public, for a price. In fact, all one has to do is show a need for one and they can get one. I know the City of Phoenix uses L1/L2 GPS receivers. If they can get them, so can any organized terrorist organization. Also, it would be quite possible for a cohort to set up a local DGPS transmitter shortly before a terrorist attack, again, these are available on the open market, or easily constructed.

Tomahawk Cruise Missiles can be very simple, or very complex, most of that has to do with avionics. Base models can be had for about \$500,000. Many years ago I got to tour the Teledyne CAE plant in Toledo, OH; where they make the jet engines for the cruise missile. I was amazed at how simple a cruise missile's design is. The design is hardly "state-of-the-art." I'm sure any country could duplicate the effort, and probably cheaper than the U.S. In fact, a small group of technically competent people could probably assemble a reasonable facsimile.

The most complex part is the jet turbine, but this could be replaced with a propeller, ducted fan, or ram jet. 3 axis stabilization and guidance could be done with off-the-shelf components designed for the model aircraft industry combined with a GPS unit.

In light of the fact that Matthias Rust could pilot a Cessna 172 through Soviet Airspace and land in Red Square, and some wacko (recently) could steal a plane and almost crash it into the Whitehouse, it will not be long before we see some type of flying bomb (either with a kamikaze pilot or possible GPS guidance) aimed by terrorist group(s) at some target. SA or not, it's bound to happen.

But currently it's easier to steal (or rent) a truck and pack it with explosives. I expect when it gets hard to make a ground attack, the terrosits will take to the air.

This is just my opinion, and I am in no way endorsing any terrorist attack on any target.

NO! NO! NO!...RTFM

There is a specific warning in the manual to NOT plug ANYTHING in the

"H" port except an external temperature humidity sensor or DAMAGE could result.

There is a loose sheet in the upgrade kit showing what gets plugged in where on both the junction and splitter box.

As far as the pinout on the serial port itself, I have seen nothing to indicate what is what...inexcusable on Peet's part.

Although i agree with a lot of what your saying Jim, do we really want to stop
going forward and start going backward. Or hide our head in the sand when
someone makes a suggestion. Even though some Hams don't like the idea of
advancing into a new world using amateur radio, it's here and being used
daily, just like Iphone, some hams don't like the idea, but let me tell you that i
talk to more hams on Iphone using Internet then i do in any other mode.
And yes Jim if you don't use the frequency we are going to loose it so why
don't i EVER here anybody on 220 at least in North Alabama.

Yes, but let's think about it. The reason we are converting the Digital
Data to audio is because the media (radio) is already set up to use audio.
In the case of the internet, it is already set up to use digital data. We
would use much less band-width and be more efficient if we sent APRS
position reports as text strings instead of digitized audio over the
internet.

Hope this helps.

I have the identical configuration and see the Wi7XXX and cKC7C0 both under Win 3.1 and under straight DOS. Doesn't seem to matter how big the P-list is (I've seen it when first bringing APRS up with just me on the P-list).

Hate to be the bearer of bad news, but it has happened to me on at least one occasion and I do not have a wx station.

I'm running 7.4e, and an AEA 232 (old(no mailbox etc)) multitasking from Windows.

I think I had switched back to Windows (3.11), done some things and switched back to APRS and there I was, someone else!!! I had attributed it to the large P-list (about 5 pages) but that was a guess.

I also get some other Call sign changes that show up as Wi4XXX with the lower case i instead of the correct call.

In either case, I can hook my or the other call, delete it and under it is the correct Call.

For whatever this is worth!

Bud

APRS and MacAPRS read AX25 UI data that has been stripped of the packet headers by the tnc itself. JNOS needs to see the AX25 headers, as well as the encapsulated TCP/IP headers in the data, so it must operate with the TNC in KISS mode. Neither APRS nor MacAPRS currently incorporate drivers for KISS - it's a non-trivial task to add them.

In addition, JNOS does not have an adequate method of setting UNPROTO digipeat paths without also affecting TCP/IP routing, and although makes an adequate TCP/IP router, is not up to the task of "digipeating" APRS data into the JNOS Internet world.

The same issues apply to NOS variants such as TNOS, G1EMM, NET/Mac, etc. It would probably be easier for the NOS developers to accommodate APRS than the other way around, as the NOS apps do support AX25 connections and UI frame

processing.

Anybody here use JNOS and DOS? I THINK we can use that system.

Anybody an expert? I have a running copy and our Club uses it on a BBS. (w8dc.ampr.org) connected to a Gateway. (Hamgate.gvsu.edu)

I have been offered a port for this use. We currently have a Wormhole to Ann Arbor MI AND Tuson, AZ

Wonder if anybody wants to try this???

I am game...

On Mon, 18 Dec 1995, Peter Short wrote:

> >Yes APRS does work on com3 and com 4.....

APR REPLY: Yes, but ONLY if you use the same interrupts. (such a waste)

RULE #1: A HAM will NEVER have enough COMM PORTS

SOLUTION: On the side of my PC, I mounted a small bracket that holds two DB-9 male serial connectors. These are connected to COM1 and COM2 on the back of my PC. On my desk top in front of these two connectors are laying a DOZEN or more serial data cables that connect to EVERYTHING in my cozy little world. I Plug in whatever I need, whenever I need it.

I have never looked at a COM card, I have NEVER had to move interrupts and have my PC die for days while I re-configure for each new aquisition. I never have used SETUP on my PC. It is as STOCK as the day I opened the box. I never have COMPART conflicts, and I can even PLUG in a MOUSE if I have to... I ALWAYS have two dedicated COM ports available for EVERY application.

Total investment is about \$0.79 per connector and about the same for the hoods...

> than that?

In some ways, this is exactly what one does with differential GPS. You put a receiver on a set of known coordinates and calculate the pseudorange (apparent range) and pseudorange rate errors for each of the PRNs you're receiving. You use these data to correct each set of matrix solutions on an epoch by epoch basis, either in real time or after the fact.

An older method of DPGS correction simply places a receiver on a known point and notes the error in Lat/Lon/Hgt and applies the appropriate correction to the solution derived by the roving receiver. The inherent problem here is that the reference site and the rover may not be using exactly the same satellites, nor the same algorithm for solution, thus making the "correction" of questionable value.

In my Cows In Space project, I am using a set of receivers that are identical and all have been set to utilize the same satellite selection criteria. They are all located within a couple of kilometers of each other, thus increasing the proability that they are all seeing the same satellites. I am transmitting DGPS data to them and getting onboard corrections in real time, to the entire

herd of 16 animals. 2 stations at sub-cm precision surveyed points are also established, using the same criteria, and receiving the DGPS data. The apparent error from the 2 fixed sites is collected and averaged, and the error from their known fixed locations is applied as a post-processing solution to improve the accuracy of my cow location.

> Another stupid question! Why cannot one simply refer to the nearest
> point of known coordinates and height, determine the
> instantaneous error between the known coordinates and GPS results and
> correct for it?

APR REPLY: That is exactly what differential correction is. The differential engine uses that data to calculate the apparent errors of each of the satellites and then BROADCASTS this list of errors in a format called RTCM-104. Most GPS receivers will accept that serial data stream and use the data to IMPROVE their position SIGNIFICANTLY! But these Differential correction engines cost THOUSANDS of dollars and require a separate serial data link to the MOBILE.

CHEAP SUBSTITUTE: If you have TWO identical GPS units (using the same software algorithms), and the antennas see the same satellites, then they SHOULD usually give the same posit. Hook one to your BASE STATION APRS and the other in your mobile. Now, since the base station KNOWS its exact posit, it simply calculates the offset and subtracts that from the mobile's posit on every packet. The mobile is therefore plotted to the same accuracy that you know where YOUR BASE station is.

- * You can figure out exactly where your basestation is by simply averaging your GPS posit over several hours(or days)
- * This only works if you are using the same model GPS for the mobile and base...
- * It only works if the units are using the SAME SATELLITES

THIS MODE IS CALLED PSEUDO DIFFERENTIAL and has been in the APRS version sold via PacComm for commercial applications for over a year...

I've seen this problem running both from DOS and Windows 3.1. I'm
running APRS 7.4c and have seen it back to 7.4 (perhaps earlier).

In all cases the i is accompanied with the grave accent mark.

I've never seen the callsign replacement problem.

So... we bloat xNOS a little more with a couple of drivers... add an APRS
digipath, attach the GPS to the computer and go on? It's do-able, but I don't
have time to do it over the next couple of months, or maybe years!

Actually, writing an xNIX/socket (or streams) implementation of APRS shouldn't
be too difficult save the graphics, and that could be an impetus for an X
application. Hmmm....

Bob, WB4APR...

One thing I forgot to mention about the Comm-buffer-overflow problem &
that is the "best" mode, or the mode that causes the least problems here
is the DATA LOGGING MODE. The system ran all night without a
glitch using a sampling/update rate of 5-seconds. But as soon as I
used the keyboard to look at the P-Page or check the B-Page for any
new bulletins, it locked up... it also locks up while drawing the map...
also locks up while doing ANYTHING that takes time away from
getting data from the weather station (U-2000)...

Hope this additional tidbit helps Bob.
It's all white here this morning with more on the way.
Geez, I wish I was back in Houston!

I've been following the problem reports re: overflow w/U-2000. I *just* ordered my U-2000 (Tuesday morning) and so have an interest.

One comment, if I may.... The brochure for the U-2000 talks about the four mode I/O port. Is there a difference in the data rate between "Data logging mode," (i.e., about once per second), and the "Complete record mode," (i.e., once per second, but more data) ? What mode is everybody using, both Bob, and those having trouble ? Could it be as simple as the "wrong" mode ?

Is anybody using a U-2000 in "Packet," or "Modem" mode ? I plan on using it in Packet mode, w/AEA PK-12 TNC and radio, NO computer. Anybody tried this yet ? Problems?

Thanks.

Both ideas have merit.

I wasn't thinking of using the system for long distance. My idea was to be able to display APRS position reports from mobile stations in near real-time and demonstrate APRS in RF hostile environments where it would be much easier to just hook a lap-top computer to a telephone and have it access a tnc located in an RF friendly environment, like our building on top of a large hill. The idea is to expose APRS to people who may not currently own a tnc, but who have access to a computer and a telephone modem.

The easiest solution provied by the SIG so far is to use a null-modem cable to hook the tnc directly to the modem. Of course, I think I would disable traffic from the modem going out over the tnc without some sort of password protection, etc.

Thanks for the advice.

This person has a PICO and INTERNAL GPS. He was being seen by EVERYONE monitoring the channel, but he NEVER saw himself on the map.

APR REPLY:

If that is correct, then your PICO is transmitting its position to everyone over the AIR, but it is sending nothing to the APRS. And since APRS ignores all of its OWN packets, it will never update itself off the air.

The PICO (without ELOC and the new ^E mode) was designed for STAND-ALONE applications. (and it sounds like it is doing that job admirably)

WORKAROUND FIX: Set the alt-SETUP-MODES-MASTER command. This was designed for letting several PC's share a single TNC such as in a COMM center. In this arrangement, all of the PC's use the same CALLSIGN, so they must also look for packets from the same callssign to see what the other operators on their TNC are doing. MASTER mode will tell APRS to ACCEPT its OWN packets off the air.

This will let your mobile PC see itself just like everyone else, ASSUMING YUR POSIT WAS DIGIPEATED!

Best thing it to upgrade to the new PICO.

You noticed that it did work the one time you changed the TNC call to something different than what APRS thought it was...

Here is my solution for connecting a Garmin GPS-45 to a KPC-3 or to a PC.

The following is a description of the connector wiring I use for the Garmin GPS-45 power/data cable to a DB-25M connector. This connection allows connecting a Garmin GPS to a KPC-3 for standalone tracker operation. Note the connections between the DB-25M pins 4 and 5, and 6, 8 and 20. This will dummy any flow-control signals to the device that the cable is plugged into. The KPC-3 was configured to send power out the DB-25F connector (KPC-3 manual Page 96; "DB-25 Wiring Options: Applying Power through the DB-25 connector").

The following is a description of the adapter cable that is used to connect a Garmin GPS-45 to an IBM PC. This assumes the power data cable for the Garmin has been wired as described above. Basically, this adapter is just a NULL-MODEM that has had the power line attachments made to it. The cable above can be plugged into the adapter below, allowing external power to be supplied to the GPS-45, while using a PC to upload/download the GPS unit.

Thanks for the info on the GPS-45 shutting itself off. I put fresh batteries in it and that seems to help.

Getting everything ready for the trip.

I really cut down the cable mess.

I am using a FT-470 HT for the radio. I gutted an old battery pack and made that my junction box for most of the cables. I now velcro the pico on the back of the radio, and have a 6" audio cable going to the top of the 470. I also now have the power/data cable from the GPS-45 going into the junction battery pack. Inside the pack I have two fuses, one for the radio/pico and the other for the GPS. There are two 6" cables from the junction pack to carry power and data to the pico. So, many of the cables have been shorten. I then have one power cable from the junction pack to my 12V 6.5 AH battery.

This now makes for a rather compact setup. So the cables are:

```
GPS ANT ----- GPS RCV -----JUNCTION PACK / RADIO -----POWER
                                   |
                                   |
                                   PICO
                                   |
                                   |
                                   LAPTOP, if used
```

So, back to packing and tweaking the setup. On the train tomorrow!!

Randy

Rendered body type: text/plain

Bob,

I am using APRS 7.4e with an AEA PK-900. I know you have built some functions in to handle the dual port capability, but had a few questions.

- 1) What port are you assuming APRS to be running on (Port 2?)
- 2) What are you using for the port switch character (|?)
- 3) When sending commands, are you sure they are going to the correct port?

My main question is with question 3. I think I know the answer to the first 2. When sending commands that are port specific the command is: port 1 command/port 2 command. And if your are only concerned with port 2 you can leave out the port one stuff and just precede the command with a / such as /mon 2 would change port 2 monitor level. From what I could see this is not being done and many of the commands such as unproto are being sent to port 1.

Aloha all. I believe the Iraqis did have a number of Garmin 45's installed in their SCUD ballistic missiles but suffered the same problem as the rest of us, when the missile exceeded 99 kts, which of course was about 1 second after liftoff, the GPS lost track and failed to provide the crucial guidance needed for ballistic bombing. So there you go, with SA and limited speed (marketing strategy) of the Garmin 45, it is no good for cruise missiles either. Personally I love my Garmin 45. I've used it in the car, a rubber zodiac and airplane cruising around Oahu, and in just a minute I'm going to use it to find my favorite spot at the beach. Dave.

the claim. I believe SCUD's of this ilk are fitted with fairly simple inertial guidance systems and were never designed for pinpoint targeting. They are a cheap terror weapon akin to the V-1 and V-2 and not much more complex.

Perhaps we can find a person stationed at Aberdeen Proving Grounds...

Bill,

Hooking up a KPC-3 to a GPS is a simple operation. Kantronics even included a one page instruction sheet on this when I got my firmware upgrade. Although it's been a while since I've done it, it seems to me I only had to set one or two lines in the KPC-3 and set the intface command to GPS. To my surprise, the first time I did this, APRS started accepting the RAW GPS data right away, and displaying it on the map in the correct position.

Note: I did have the advantage of two tranceivers and two TNC's, so setting up a low power simplex link was not a problem. This does help in trouble shooting. I really like the fact that I can turn the GPS Beacon on and off via the remote mode of the KPC-3.

It didn't take me hours, it only took about 5 minutes. Of course, since I usually use a digital mode repeater for my APRS work, setting pathways isn't necessary, and I've never bothered to alter my GPS string, since APRS will accept the raw data. The only thing I've changed is my SSID to get different icons. But since this is all stored in the KPC-3's memory all I have to do is set the intface to GPS when I want to use the setup as a tracker. I admit it may be a little more difficult in other circumstances.

If you (or anyone else with a KPC-3) require assistance, please e-mail me.

Look folks, the first nuclear bomb to go off in the United States will probably ride in on a donkey cart!

The real issue is that our government needs to realize that the GPS system is both a military AND a commercial resource crucial to our nations well being. SA is merely spawning a differential-correction industry (companies like DCI, and organizations like the Coast Guard) that aren't really necessary, and I doubt it is contributing much to our security. My guess is that should ICBMs get launched, GPS would totally shut off or otherwise make itself useless to hostile forces.

On a related note, isn't it about time GPS users who are not US tax payers contributed to its upkeep? Is this already happening? How about we shut the birds down from time to time over other parts of the world till some other well to do nations pony-up?

Cheers.
Jim, WU0I

I just went to fix the U-2000 overflow problem and noticed that every time I start up APRS, that the TNC sends out some of the TNC-INIT stuff over the air.

I know this happens sometimes, but now it is happening EVERYTIME. I RESET my TNC to factory defaults, and it still does it! (each startup of APRS)

This is with 74e. Is everyone else seeing this or Have I just got my TNC screwed up...

Two points to ponder were made at the ION GPS-95 conference:

- 1) Having S.A. on during peacetime enables a potential adversary to develop and test means of defeating it (SA!), thereby rendering it ineffective during periods of tension.....
- 2) Reliability of the GLONASS spacecraft has increased dramatically over the last couple of years ther
there are now almost as many Russian satellites on line as GPS- and dual-compatible receiver designs are being developed.

In response to the comment on velocity limits, commercial vendors (in the US at least) of SPS receivers are obliged by the US government to limit either velocity or altitude useability of their receivers in order to preclude their use in guided munitions.

APR REPLY: APRS sends the commands just as you enter them... If you want to set up a path of X,Y,Z on the first port and A,B,C on the second one, then you must enter an unproto path of X,Y,Z/APRS VIA A,B,C...

APRS will send the path just as you enter it. So put what ever you want into the proto command including dual port paths. Notice that APRS DOES put the initial UNPROTO APRS VIA.... on the beginnning....

I would like to know the error ellipse for GPS-provided position reading. For my purposes, an error ellipse is a 2-D region around the predicted lat/long wherein the confidence that the "true" position is within this region exceeds some threshold (like 50% or 95%). It seems that an error ellipse might be real handy if the x-dimension error is much greater than the y-dimension, or visa versa.

Is such a thing output as part of the NMEA-0183 spec? I am using a Garmin GPS-75 at the moment, with a commercially provided differential correction input. I would appreciate any suggestions.

Thanks.

I've had the same thoughts, but be careful! One idea already tossed around by some armchair lawmakers at one point was: those who USE GPS PAY for it, and the best way to collect usage fees is to either charge a tax (potentially very large) on all GPS receivers, and/or (2) require a license and an annual fee in order to own a GPS receiver. Your idea might work and get other countries to pay up, but it also might mean changes for GPS users in the U.S. as well. Changes you may not favor.

>73 de Donn
>WA2VOI/0

Don, the only mode supported by APRS (computer program) is the data logging mode. (AFAIK)

We DO NOT want to change to another mode for use with APRS software or we lose the ability to use the 2nd serial port output of the U-2000 for logging real time data to disk. The Peet Bros software requires that the U-2000 be left in the data logging mode, so for APRS with computer setups, it is IMPERATIVE to stay with the standard data logging mode.

Besides, I am not sure APRS will properly decode the "packet mode" output of the U-2000, as it was designed to parse a full data sentence from the data logging mode. One thing to keep in mind: the structure of the data coming out of the U-2000 is TOTALLY DIFFERENT for each of the four supported modes, i.e., data logging, packet, complete, modem.

So far we have learned this much:

1. Some machines don't see the problem at all (Bob's for instance!)
2. Those of us having the problem (everyone else?) see some improvement by updating the Wx data more frequently than the default of every 15 seconds. Bob uses 8, and I have tried 5. In each case, the program would go longer without crashing, but still crashed. At 15 seconds, it crashed immediately.
3. It does not seem to matter whether one is running dos 5.0 or 6.2, both produce the same problem.
4. Eliminating memory managers like QEMM, doesn't help.
5. Speed of the machine doesn't seem to help. Bob is running a 486dx33, I am running a 486dx2/80 with 8 mb ram and a fast pci video card.

Looks like a timing or sampling problem because the U2000 puts out MUCH more data than the older U-II did. (90 data sentences per minute vs. 17)

Bob will get this figured out...he has everything else! It is a pity he can't reproduce it with his own machine. That is going to make the fix much more difficult.

Jim-

For standard SPS service (i.e. L1 only), the reported accuracy ellipsoid as I recall is 100 meters horizontal, 168 meters vertical, 2-sigma (95% confidence). However, you stated that you are currently using a Garmin GPS-75 with commercially provided differential corrections. In that case you should defer to the claimed accuracies offered for the type of service. DCI Corrections and Acqupoint can provide accuracies within a few meters to sub-meter levels depending on the type of subscription service you choose. The USCG differential beacon stations are good to within tens of meters and is a free service but requires the purchase of a beacon receiver.

As far as the NMEA-0183 standard, the only NMEA sentences I found that might help give you a "feel" for absolute accuracy were \$GPGGA and \$GPGSA. \$GPGGA provides a value for HDOP (horizontal dilution of precision) and also provides the time in seconds since the last SC104 Type 1 or Type 9 update. \$GPGSA provides the PRN numbers of all the satellites used in the navigation solution plus provides values for HDOP, VDOP (vertical DOP), and PDOP (position DOP). [Info only--PDOP is the root sum square or RSS of HDOP and VDOP]. In general, a PDOP of 3 or less is desirable and indicates acceptable satellite geometry. PDOP can increase if certain satellites are blocked from view forcing a navigation solution from less optimally positioned satellites. Since I do not have a Garmin GPS-75, I do not know if any of the above information may be helpful.

For Bob (APR)

Yes... APRS does allow some TNC parms to get out on-the-air.
Several of the "Jersey" users asked me about that. It kinda
"initializes" the TNC so the TNC continues to beacon them until
it gets it's real beacon from the U-2000 or the second line of the
CFG file. Just got BETA2000.ZIP --- Will let you know what happens!

So far, the 7.4f is working with my U-2000 (DATA LOGGING Mode)
with no glitches EXCEPT the TNC parms that get out occassionally.
I have the sampling/update rate set for my normal 15-sec's with a
beacon rate of every 5 minutes.

I can play with various LISTS/Pages and even send some one-liners
to some users, redraw the map and everything continues just as
good as it did with the U-II.

Except for the TNCparms that "escape", looks like you got it fixed
Bob... at least from my configuration here...

286 CPU 640M RAM 2 serial 1 parallel,20M HD DOS 5.0

As you can see not the most updated system but it's just a weather station... not a precision rocket launcher (!) and I'm not going to waste my two 486's on a job easily done by a lesser machine.

Thanks for taking a look at this.

Rendered body type: text/plain

Well, My WX alarms went off the last two nights and I tracked it down to a WX station running the AUTOWX program. This program appears to output APRS formatted WX reports but it has two problems:

- 1) It uses an @ at the beginning of the packet. That character is reserved for APRS stations that are ON LINE and CAPABLE of receiving APRS messages. The AUTOWX program should begin its report with a "/" which indicates am OFFLINE APRS station, or other device that does NOT ACK messages
- 2) I called the author of AUTOWX and he told me that the RAIN and PRECIP values are the RAW U-II counts! Bummer. APRS defies the ON-AIR protocol for RAIN to be RAIN PER HOUR and PRECIP PER DAY. This means that unless an AUTOWX operator ZEROES his U-II counters Hourly and Daily, the values are NOT correct according to the definition.

ALSO as soon as you get 9.99 inches since the last time the operator ZEROED his counter, then EVERY ALARM IN EVERY APRS station is going to go off! If you have someone runnig AUTOWX in your area, be sure he is zeroing his RAIN counters to avoid these nuisance alarms!

Hopefully the author of AUTOWX will change to the sliding per hour and per day APRS definition...

Help! My PicoPacket, (2 serial port model, release 3.2.9.2, 25 Nov, 95) has lost its ability to update via HSP. I can still read via ELO and LOC, but F8 and POSrate just get "HSP Port Timeout" message. Have double checked all the cables and GPS (Garmin 45), and Pico unit otherwise working properly. It was working when I first hooked it up on the

Joe Carter, AA8SF
jbc5@po.cwru.edu
aa8sf@wa8bxn.neoh.oh.usa

when APRS tries to talk to the tnc in the foreground, it would lock and the only way out of it was to end the task in windows 95.
Also every time I started it up it would have com i/o glitches and would take a while before it would talk to the tnc, that works ok now. It ran all last nite without a glitch.
I am using a Pentium 60mhz, with four 16550 serial ports, and of course, I can only run APRS on com 1 and 2 because of the IRQ addresses of com 3 and 4 are irq 5 and irq 11, which are not supported by APRS.
My Mouse will only work on com 1 or 2, which leaves APRS to TNC on the other, now how can I run the wx station on com 3 or 4 with APRS, are the driver's in the works?
Will check it out as soon as my UII with U2000 upgrade arrives,
Best of Season's Greetings to the SIG

> itself useless to hostile forces.

More than likely, if we have a sufficient launch warning, we'll shut down a lot more than just the GPS birds, to diminish the flash-damage from an airburst. Generally, if the launch vehicle is ballistic, I'm not too worried about a GPS-guided terminal phase. I'm just plain worried. An airburst over Houston would complicate my life needlessly, although I doubt a minor power would target College Station and complicate it significantly...

The various Differential sources are, in fact, needed to improve position data over that provided by Standard Positioning Service for precision applications. Surveying, which uses L1 and L2, requires use of a base station and either real time (kinematic) updates or post-processing to achieve sub-cm precision. Similarly, the Coast Guard and Corps of Engineers have been experimenting with RTK navigation-aided ship handling in restricted channels. Neither of these, nor a host of other applications can be achieved using SPS or Precision Position Service natively. And "Why not," you ask? Simple answer. The satellite precise ephemeris sent by the Space Vehicles (I sure hope W3IWI isn't looking:-) is accurate enough to place the location of the satellite within (about) a 10 meter spheroid at any given time. Assuming, for the nonce, that Selective Availability is OFF, and minimizing errors in the various onboard clocks with regard to the master reference clock, you have a potential pseudorange error, off the top, of about 17 meters (2-sigma). Signals travelling through the ionosphere and stratosphere are subject to some induced delay. While this is modelled, and the model data are updated periodically in the Broadcast Message, the fact is the model is not perfect, and compensation based on it is prone to some error.

Use of several satellites to determine position, and use of a Least Squares Estimator to compare various solutions, as well as smoothing based on carrier phase and code phase data allow some increase accuracy of the solution. SPS uses a shorter sequence of Pseudo Random Numbers in their system than PPS. This, too, contributes to less precision in determining a fix. Oh... And I forgot to mention multipath. This bugaboo can nail both SPS and PPS systems. On our surveying gear, we use a .7 meter (diameter) groundplane to minimize the effect of reflections and multipath, and attempt to set the antenna as high as possible (a couple of meters) to reduce the effects of local reflections. Trimble recommends, as well, that vehicles be restricted to no closer than 100 meters when a precision point is being taken. On a good day, using L1 only without L2 code or carrier phase correlation, discounting most of the ionospheric delay and discounting multipath, you can expect about a 10 meter diameter ellipsoid of error for SPS and about a 3 meter ellipsoid for PPS.

Real time correction can occur at several levels. For discussion, I'll talk about the two I spend most of my time with: RTCM ("Mapping Grade") correction was originally developed for harbor navigation, with aviation industry input, and will improve SPS and PPS by about an order of magnitude (100 meter [a BAD day] -> 10 meter; 10 meter -> 1 meter or so...) and RTK, which most of the cheap GPS receivers cannot handle, which is able to allow significant submeter resolution (we can usually reproduce 2 cm error ellipsoids around here).

RTCM (Radio Technical Committee for Maritime Operations) corrections are based on using a base station at a known point, and assume, typically, an L1/SPS-grade receiver. The receiver compares the pseudorange (apparent range of the receiver to the spacecraft) based on timing signals with its calculation of the spacecraft's anticipated pseudorange based on the broadcast ephemeris (sent by the individual birds), and issues a set of corrections. It also sends timing (Epoch) data and satellite health data so the receivers can error out a satellite if it's unhealthy. This, of course, demands that the base station and the roving station receiving the corrections be looking at the same satellites. If they're not, then only limited correction can occur. FURTHER, as you get farther from the base station, the precision of the correction diminishes. Thus, a base station 350 km away may not give much improvement over an autonomous position fix.

> On a related note, isn't it about time GPS users who are not US tax payers
> contributed to its upkeep? Is this already happening? How about we shut
> the birds down from time to time over other parts of the world till some
> other well to do nations pony-up?

No. We have national interests ("military") in a lot of those areas. If we turn off SPS their PLGRs stop working, too. And, it'd be pretty irresponsible to turn off a mode we turned on simply to try and strongarm some change from the rest of the world. What we're doing, instead, is gaining access to the GLOSNAASS system the Russians have launched and maintain, and are continuing to do so at no cost to the world. Newer receivers are starting to come out that are capable of receiving both systems, and either select the best fix, or integrate the two. So, tell me... you're flying your light twin over Europe, with your Garmin GPS-150 onboard, meeting the applicable FARs for enroute navigation, and complying with the appropriate ATC regulations for the airspace you're in (they allow enroute navigation by GPS too) when the lights go out... Once you've started using it, it's no fun to have to go back to VORs. And if you're in IFR conditions, and your situation changes like that, you're suddenly in a significantly increased-workload environment. That's no fun.

No, thank you, I don't think strong-arm tactics are appropriate here.

Hi Mike,

Thanks for you response concerning GPS error ellipses. Your comments bring to mind still more questions:

(1)

I presume the precision provided by the GPS receiver is DYNAMIC, and changes as a function of which birds are in view, how many obstructions are around me as I drive around, etc. Will the GPS receivers' "HDOP" reflect these factors and change accordingly?

(2)

Is it true that the errors will tend to be evenly distributed between the x-axis (east-west) and y-axis (north-south)? Is it ever the case that the x-axis error is much less then the y-axis (or visa versa), and would the GPS receiver be able to predict this?

(3)

I am investigating both DCI and the Coast Guard beacon receivers for differential correction information. Why do you say the Coast Guard correction information provides accuracies "within tens of meters" while DCI can get into the meter range? Does this have to do with how far one is from the reference receiver? What if the reference receiver is close?

I would appreciate any input on this.

Thanks for the help!

73s
Jim, WU0I

RE: APRS on CB, Marine band, and other channels

It depends on who's lawyer you talk to, hi hi.

DIGITAL DATA transmission is prohibited on CB

Selective calling, using tones for the purpose of establishing and/or maintaining communications IS permitted. Tones cannot last LONGER than 15 seconds.

I talked to the FCC, and there is NO STANDARD for "selective calling" Almost all selective calling these days use digital formats and they are not considered DIGITAL DATA in the prohibited sense...

ERGO, its legal in my eyes...

My Apple Service Guide says a "straight cable" for a Apple //e super serial card to modem. You turn the plug in the super serial card to the correct position (modem).

The cable is pin for pin with DB25M on both ends. The pins used are: 1,2,3,4,5,6,7,8,20 and they go to the same pins on the other connector. (Apple Service Part Number 590-0037)

Bob can you fill us in on how your APRS DGPS works, I can not find it
in the HELP.TXT file under ALT S....
I see it there ALT S, then GPS, then it shows DGPS
also on the command line I see dgps go to DGPS when
I select it , but nadating happens...

I tried GPS connected by HSP switch, on sepearte com port,
turning GPS off and on etc. but without any documentation
that I can see (maybe I missed it) I can not figure out how
you impliment it.

Also is it possible to run DGPS, GPS, WX, and DF all at the same time
or do I need individual TNC's and computers for each??

tnx in advance.

Rendered body type: text/plain

I know this appeared in the discussion some months back but I didn't save a copy of the solution. The problem is that APRS sets the PK-88 TOne to 2 when it needs to be set to 3. The question is, which of the .TNC files needs to be modified to contain the necessary "TOne 3" command, INITAEA.TNC, RESTORE.TNC or both? Or, should a different TNC be spcified at startup?

Just last night I discovered the altered TOne setting after trying to figure out why my PK-88 had quit working after trying to bring up APRS for the first time this past Saturday. Pretty frustrating after having repaired my radio which had defective crimp in one of the internal wiring harnesses from the factory which caused the audio to come and go (go mostly). Seemed like everything wanted to keep me from running packet.

626. Coast Guard beacon receiver designs for differential data?

From: Jim DeLoach <jim.deloach@cellnet.com>
Date: Wed, 20 Dec 1995 10:39:20 -0800
To: aprssig@tapr.org
Message-ID: <199512201845.KAA02245@cellmail.cellnet.com>
Rendered body type: text/plain

Does anybody know of any published low-cost Coast Guard beacon receiver designs in the ham or hobby press? These would be a nice accuracy add-on to all the low-cost GPS users out there.

My understanding is that these transmissions are on long-wave (~140 kHz or so?) using an MSK modulation at 100 baud. Is this right? What do the signal strengths look like, and would this be a particularly difficult design?

Would there be any problem with APRS compatibility?

73s all,

Jim, WU0I

p.s. Comercial units seem to start at ~\$400. and go up into the thousands.
Is there really that much value in these units?

WB4APR REPLY COMMENT:

| | |
|---|-------------|
| Only the GPS can share the HSP with the TNC. | See GPS.txt |
| The WX needs its own port at 2400 baud | See WX.txt |
| The DF can share a single port with the TNC (and HSP-GPS) | See DF.txt |

DGPS in APRS, simply means that IF SOMEONE on your local net is
transmitting RTCM-104 via PACKETS then APRS will pass those out the GPS
comm port. If you have wired the OOUTPUT of that COM port to your GPS
differenetal INPUT, then your GPS will be happy.

NOTE: Unless the DGPS station ransmits at least one pacekt every 30
seconds, the data is not worth much. That sure ties up a channel.
If you are going to spend hte \$5,000 for a DGPS station, then send that
data via packet on a DEDICATED CHANNEL. Then all mobiles operate split
and LISTEN on the DGPS channel, and XMT on the APRS channel...

The PSEUDO differential correction where APRS corrects all ON-AIR posits
based on the offset of its OWN attached GPS is only in the commercial
version of APRS being sold by PacComm.

> needs to be modified to contain the necessary "TOne 3" command,
> INITAEA.TNC, RESTORE.TNC or both? Or, should a different TNC be spcified

WB4APR REPLY COMMENT:

I cannot fix this problem, until someone sits down and uses a dumb
terminal program to send EACH of the commands to their PK-88 that are in
INITAEA.tnc (or INITTAPR.tnc) and tells me WHICH of my commands is
causing the PK-88 to switch TONES...

Please someone with a PK-88 do this..... Thanks.

I think the Pk-88 is TAPR compatible, so tell APRS you are using a TAPR
TNC, and then APRS will use the COMMANDS in the INITTAPR.TNC file...

630. APRS MIM Telemetry Module

From: Bob Bruninga <bruninga@nadn.navy.mil>
Date: Wed, 20 Dec 1995 16:01:01 -0500 (EST)
To: aprssig@tapr.org

Rendered body type: text/plain

The Micro Interface Module (MIM) is a complete telemetry and packet transmitter on a chip. It can be considered to be the TRANSMIT side of a TNC which sends out the following packets on a user defined schedule:

- 1) A FIXED Beacon text
- 2) A telemetry packet with 5 analog values and 8 individual BIT values
- 3) A position packet if a GPS card is attached
- 4) An optional CW ID.

We just sent out the art work and should have a handful of MIM cards available by the beginning of January. Here's what we know so far:

**** PRELIMINARY INFO ONLY **** SUBJECT TO CHANGE ****

SIZE: 1.5 inch by 3.25 by 0.5 inches (prototype)
Much smaller in production using surface mount...

| | | | |
|---------|----------------------|----------|-----------------------|
| INPUTS: | Five Analog | OUTPUTS: | AX.25 packets (audio) |
| | Eight BIT inputs | | PTT |
| | Vin 8 to 40v (15 Ma) | | 5 volts regulated |
| | RS-232 (NMEA) in | | RS-232 out |
| | Rcv DCD input | | |

FIELD PROGRAMMABLE via serial port:

- * Callsign & SSID
- * UNPROTO path
- * BEACON Text
- * BEACON period 5 secs to 21 minutes
- * POSIT period ditto
- * TELEMETRY period ditto

FUTURE OPTIONS: * LOW POWER Sleep mode for extended timing periods
Less than 0.015 ma
* Extended timing periods
* Timed OUTPUT pin for powering up GPS

COST: \$89 intro price plus shipping and handling
Quantity discounts and OEM licensing will be available

<I presume the precision provided by the GPS receiver is DYNAMIC, and changes
<as a function of which birds are in view, how many obstructions are around
<me as I drive around, etc. Will the GPS receivers' "HDOP" reflect these
<factors and change accordingly?

You are correct that GPS accuracy is dynamic, dependent on a lot of factors. HDOP, however, is a measure of dilution of precision due to less than perfect satellite geometry which it knows based on the satellites used in the navigation solution. This value does vary with

time as different satellites of the GPS constellation come into view. It does not, however, reflect degradation of accuracy due to Selective Availability or ionospheric delay factors.

<(2)

<Is it true that the errors will tend to be evenly distributed between the
<x-axis (east-west) and y-axis (north-south)? Is it ever the case that the
<x-axis error is much less than the y-axis (or visa versa), and would the GPS
<receiver be able to predict this?

I have not seen anything in the literature as yet that gives a preferential bias towards North-South accuracy vs. East-West accuracy. My experience in plotting GPS positioning wandering at a fixed location over a period of time (say 24 hrs) does not appear to show any directional bias. This is a simple enough experiment you may want to try yourself, with or without differential correction.

<(3)

<I am investigating both DCI and the Coast Guard beacon receivers for
<differential correction information. Why do you say the Coast Guard
<correction information provides accuracies "within tens of meters" while DCI
<can get into the meter range? Does this have to do with how far one is from
<the reference receiver? What if the reference receiver is close?

The distance from the reference station is a factor since errors such as ionospheric propagation delays can be different at your location compared to the reference location and therefore would not be completely removed or eliminated as a common mode error source. This same logic applies when I commented that DGPS services such as DCI or Accpoint have errors within several meters or less, depending on the type of service purchased, due primarily to its local use in a metropolitan area. Since these differentially corrected signals are encoded on a subcarrier of a local FM station, its inherent range is limited to principally line of sight, more or less. The VLF beacon stations, on the other hand, can travel larger distances over the surface of the earth (compared to local FM) which is due primarily to the propagation characteristics of the low frequency signal. Using differential corrections of this type several hundred miles away on land is less accurate than, say entering a harbor where the Coast Guard DGPS transmitter may only be a few miles away.

### 635. Map of the Prescott, Az. Area

From: "Alan K. Unangst" <alanwc7r@primenet.com>  
Date: Wed, 20 Dec 1995 14:59:46 -0700  
To: aprssig@tapr.org  
Message-ID: <199512202159.0AA19220@usr1.primenet.com>  
Rendered body type: text/plain

I have made a map of the Prescott, Az. / Yavapai Co. area, and rather than  
clutter up the TAPR site I will send it directly to anyone who want it.  
Drop me E-Mail, DIRECTLY, and I'll forward it to you (Directly)

E-Mail is alanwc7r@primenet.com

Comments on the map will, also, be welcomed!

73,

Alan, WC7R  
Alan K. Unangst

I can understand that ok, could you please send me down
about 10 lines of RTCM-104 code as seen by APRS, I would
like to see if I can generate similar code to feed in on the
rs232 port from another computer that has a fixed GPS
and a known location to see if I can simulate a DGPS station
in my Hamshack. I have a few Raytheon 900 GPS rx's
that I would like to try out for this application.
Too many toy's not enough time on my hands....
tnx in advance

### 640. Re: U2000 and APRS

From: N4QEA <moyers@ibm.net>  
Date: Wed, 20 Dec 1995 22:12:28 EST  
To: aprssig@tapr.org  
Message-ID: <199512210309.DAA13301@smtp-gw01.ny.us.ibm.net>  
Rendered body type: text/plain

I have been watching the sig on the problems and have been trying to  
work this out since back in version 74d. I have attempted to run APRS  
and the U2000 from plain stripped dos, from DOS/Desqview, and from  
inside an OS\2 Dos window. To date my best luck has been from within  
OS\2. The last experiment I ran seemed to be the most productive at  
finding a cause. From what Bob told me I decided that APRS buffers  
all comport data anytime the keyboard is active. I had also observed  
that the hangs between the U2000 and APRS occurred immediatly after  
returning APRS back to talking to the comm ports. Infact it looked  
like APRS was attempting to talk to both com ports at the same time.

In my experiment I turned the radio off still leaving the TNC and U2000  
active, and then entered along comment message and waited a couple of  
seconds before sending. This time NO HANGS, A quick comm-buffer  
overrun message but NO HANGS. This indicated that what was happening  
was that the buffers inside APRS were overfilling with TNC data and  
were not able to dump before APRS toggled the U2000 for data.

So, I knocked APRS down in the DOS window and opened back up in its own  
window and tested it again (same test). This the system hung. So  
after some minor tweaking of timing PARMs for the APRS DOS WINDOW I  
have this working. Now I'm seeing some corrupted data from the TNC  
every so often but nothing major.

I have suggested to BOB that he Hardware flow control the tnc anytime  
he needs to stop data from it as well as when it toggles for the u2000  
port, instead of buffering the data. The TNC's have built in buffers  
just for this and may help.

I disagree...

The technical discussion allows me to further understand how GPS functions.

It is discussions like this that help to design and improve things. Hams used to do this all the time before they became appliance operators.

>  
> Please someone with a PK-88 do this..... Thanks.

Bob, None of the commands in the INITAEA.TNC file will cause the problem, I ran them all through the PK-88; however, if at any time a Vhf OFF is sent then a Vhf ON is sent, the PK-88 will change to TOne 2. Vhf OFF causes the PK-88 to set TOne 1. The interesting thing is that if Vhf is already ON, sending Vhf ON again does not change the TOne setting from 3 to 2. This only happens when Vhf is switching from OFF to ON.

Hope this help.

I don't have anything handy here, but should be able to send you something tomorrow, IF it's needed. I'd recommend, since RTCM-SC-104 sentences are not, strictly speaking, ascii (excluding the NMEA-similar new stuff) that you grab a couple of the back issues of the institute ofNavigation, and peruse it. I'm doing something similar for a research application, using the Motorola OnCore engines.

Tell your receiver to go into a position hold mode, and feed it a reference point. Now, ask it to give you the pseudorange correction and pseudorange rate correction on an epoch-by-epoch basis. Barring that, do the ephemeris calculations (SGP3, I believe), and compare the instantaneous results with the receiver-calculated pseudorange and range rate calculations. On a satellite-by-satellite basis, extract the deltas between the calculated numbers and the pseudorange and rate data determined via timing by the receiver.

The format's not too bad. The matrix solutions are time consuming.

Bill,

I'm real sorry you didn't like the missive. It's \*not\* junk, but it was long.  
It \*is\* GPS related, and as there has been some interest in enhancing accuracy  
and precision using DGPS, I did not feel it too far out of line.

You've done quite a bit of good work lately with the maps of Alabama. I think  
what I have to add is on the technical end. I have been pretty busy, and hve  
not done much map-making. I have been doing some DGPS making, some research,  
some publications and scientific presentations. And going to school.

I'm sorry if you were offended by a discourse on how something works. If  
that's not good enough, Goodbye.

Gerry

Depends on the mission. DoD is interested in providing C/A code to allow  
initial timing lock for PPS (P(Y)code) acquisition, and incidentally letting  
the civilians use C/A code in the interim. USCG is interested in general and  
harbor maritime navigation. They're interested in relatively precise  
locations around their harbors with allowable dilution on the high seas.

DoD is interested in confusing the terminal phase navigation of ballistic  
entry vehicles and of cruise missiles headed for US forces and/or troops. USCG  
has more interest in using the system to get up the Houston Ship Channel  
safely. And the last time a ship was ballistic in the Houston Ship Channel  
area was when we blew up the fertilizer ship in Texas City in 1947! :-)

The demise of ham radio is Irrelevant: This is not a general ham radio mailing list, not a general system design mailing list. It is specific to APRS.

Your reasoning is not far from "I find it interesting, so therefore it is appropriate to discuss in all contexts." The interest or educational value is not the question. I could give you tips on computer architecture too (or keyboard ergonomics, or antenna design, or direction finding, or vhf propagation, or software engineering, or computer graphics, or ...), which might further your understanding of things remotely related to APRS. But this is clearly not the place to conduct extended discussions on remotely related subjects.

So if you are really interested in learning more about GPS, go find a GPS mailing list/news group/discussion, or if there isn't one (I find that unlikely) start your own. All this missile crap and politics has no business in an APRS mailing list. Just because something is remotely related to APRS does not mean that this is the best place to discuss it.

This list has about the lowest signal to noise ratio of any list I have ever read. Let's not try to make it worse.

## 650. GPS ALTITUDE AND ETC

From: KD4EMI@aol.com  
Date: Thu, 21 Dec 1995 01:20:28 -0500  
To: aprssig@tapr.org  
Message-ID: <951220211636\_95858778@mail06.mail.aol.com>  
Rendered body type: text/plain

Folks I want to take a sec and remind everyone that  
I started this thread with

:MY GARMIN 45 Doesnt give accurate altitude...etc etc"

WE have digressed to Tom Clancy and Missiles etc ad nauseum.  
ALL I wanted to know was why the GPS didnt work as well as my  
friends' GPS. This has been answered. Although I enjoy elsipsoids,  
sinusoidal nodes, mutipath, and now ICBM topics...I think we got  
off the track and have permutated into hypothetical gobblygook.

Noting this I thought I would clear the air and discuss the recent meteor  
event, and a story that should make a few of you laugh.  
I recently purchased a ICOM 706. It's in the car. I'd not really payed much  
attention to the meteor scatter event. NOW since I have ssb and CW on  
2 meters the thought has crossed my mind to play with it. NOW THE  
FUNNY PART

I was on a date last weekend and we were parked in my car, and I was  
getting a little "brave" with my new date. (Im keeping it clean).  
I noticed a flash in the sky and saw an ionization event (a shooting star).  
Then a few more. I told my date about how we use that ion trail to bounce  
signals off of and make distant contacts. (SHE YAWNED)  
Then I told her that I could take advantage of the event and try to fire  
up the 2m CW rig and make a contact. (YAWN AGAIN)  
She didnt seem too interested.

So I took her home.. Didnt get any (Dx) either...  
Warning to the wise...

Either

A: Get a girl who appreciates ionization events  
or

B: Stay home if you want to work DX

She wasnt my type anyway :)

Let's enjoy the sig and move along now...thanks for all the responses  
on the gps situation (I only hope that this little ditty doesnt start

some mutant thread again)

I hate to be argumentative, but couldn't you practice a little of what you preach?

What does a personal gripe have to do with APRS? Couldn't you have sent this via private e-mail? The topic at hand is properly noted on the SUBJECT line. If you do not care to read about "GPS and Missiles" then skip past articles labeled with this subject line. It's that simple. Sooner or later the people engaged in this digression will once again return to topics more akin to APRS.

And if you think this list has the lowest signal to noise ratio, why do you stay?

Hello All,

I am Dan (ke6lof) in Stockton Ca. I've been operating APRS for nearly a year and a half. Now I feel it's my turn to contribute to the community as much as I can. I am looking for help in making maps for my local area. So far I have downloaded the maps from the USGS and have gzip and all the utilities needed for the job. All I'm looking for now is the proper way to put all this together and apply it to APRS.

Any help will be graciously accepted.

Rendered body type: text/plain

CELLULAR AUTOMATIC POSITION REPORTING SYSTEM (APRS)

\*\*\*\*\* PRELIMINARY ANNOUNCEMENT \*\*\*\*\*

With the newly developed Cellular APRS Transmitter (CAT), any vehicle or individual with a cellular phone and a GPS can report his position to home base nationwide wherever cellular service is available. At the home base, the position report is automatically displayed on a map display on the dispatcher's computer or networked to other PC's throughout the company. In addition to the position, a status message selected from literally dozens of pre-arranged messages can be sent. The cost of each position/status report is the same as the minimum 1 minute rate with your cellular carrier. Today this is typically less than 50 cents.

The CAT is about the size of a cigarette pack and interfaces your GPS to \*ANY\* cellular phone. It does not require the expensive data interface that is available for only the top-end phones. To avoid unnecessary phone charges, and report the most meaningful positions, a position report is only sent when the driver/operator presses a button. The CAT has a number of status switches which can be set to indicate any number of pre-arranged messages. The messages are field programmable. Optionally, several channels of telemetry from the vehicle can also be included in the message.

The Dispatcher Interface (DI) is a box that connects the APRS display computer to the phone line to receive the incoming mobile reports. Using the DI, APRS can maintain a track on up to 80 or more mobiles depending on their reporting rate. Maps anywhere in the country are available at various levels of detail. Since the primary application is the interstate traveler, the basic system comes with maps of the entire USA with all major roads and interstates.

The cost of the CAT's are expected to be around \$100 each and the Dispatcher Interface around \$220. Product availability this spring. Prices are only estimates pending production costs...

Gerry i'm taking you advice and am UNSUBSCRIBING to the APRS sig for the simple reason that just now out of 19 messages received 2 were actually related to APRS and i believe you are the surst of the lot. You where the one that made statements to me to keep things on topic and to keep the messages short because some users paid for having to download these messages. Well this must be just for other people and not you. We have all learned how well versed you are on all subjects, but this subject is getting out of hand. There are many other places on the internet better suited for discussions like what's going on here. I bet there are even groups on the net where you could find out how to build a cruise missile, but still don't see where this is related to aprs unless Bob is going to include a missile guidance system into aprs. This is why i have to say this to Gerry DO AS YOU TELL OTHERS TO DO. So it has been great while it lasted and thanks to those that have supported me in what little i have done to support aprs. It's been great and Merry Christmas and a Happy Newyear to all.

Many of us have to pay to download. I don't have a local phone number to the internet, so I pay for every byte downloaded. Off topic silliness also wastes the bandwidth available on the internet. So from a resource point of view, this GPS missile stuff is a complete waste. Deleting by subject saves no money or bandwidth. Posting publicly opinions about off topic messages is appropriate, as it helps educate contributors to the list. So while you advise to wait the digression out, many of us are paying for it. I can't tell you how much we appreciate your cavalier assessment <g>.

If this list were moderated, most of the gps/missile message contributors would have been "hatted" and that would be the end of it. Public education and a wee bit of consideration would solve the problem. Giving someone a hard time for doing what is appropriate for the list is hardly helpful. 73,

## 661. Re: [APRSSIG:5443] Have Fun

From: Gerald J Creager <gerry@cs.tamu.edu>  
Date: Thu, 21 Dec 1995 09:05:23 -0600 (CST)  
To: aprssig@tapr.org  
Cc: ke4eer@ro.com  
Message-ID: <199512211505.JAA03563@solar.cs.tamu.edu>  
Rendered body type: text/plain

Bill, and others...

It was NOT my intent to drive you or anyone else from a list. What I had done  
was probably to respond sharply last night after a long day at the office, to  
what I interpreted as a direct attack.

For the record, whe I see a question, I tend to answer it; when I see an  
apparent error in conception correct it. Those answers are not always short.

GPS is central to the theme of APRS. We have frequently complained or  
lamented the continued use of Selective Availability, and wished for ways to  
do something about it. This has occaasionally led us to corrections  
techniques.

I've recentltly spent most waking hours working on a low-cost DGPS base. What  
I sent out was based a lot on that work. When it's ready, we expect to have  
the proverbial \$500 DGPS station... based on parts and a little software...  
for research and other "scatter 'em where you need 'em" technology. This is  
something that \*will\* be practical for a local APRS network.

I did make a couple of specious comments regarding nuclear devices and  
missiles. These were off the track of the group. They were also in response  
to someone else's comments. Since the comments were brief, and I \*was\* trying

to make a joke of them, I didn't see too many problems therein.

I'd prefer to not see you leave the mailer. You've come up with a lot of good work and we need enthusiastic folks to stay involved in this hobby. We also need to be able to disagree occasionally without the heat and light that's been exhibited here.

I'd really have to agree with a couple of comments I've seen lately... scan the Subject: line, and if you don't want to read it, then kill it. I've a whole group I do that with because I don't want to unsubscribe for the next 4 weeks, but I really don't have time to read their stuff! I usually try to keep my replies to the subject at hand. Sometimes I digress... I'm a story-teller at heart, and it shows. But my real intent is to get the answer across and go on.

Regards, and Happy Holidays,  
Gerry

ps... I'll be incommunicado for the next week, visiting my wife and completely without a modem or dialup facilities (unless there's something under the tree I don't know about)

## 663. APRS/S Claus

From: "John B. Leonard" <jleonard@tbcnet.com>  
Date: Thu, 21 Dec 95 10:00:07 -0500  
To: APRS SIG <aprssig@tapr.org>  
Message-ID: <199512211600.KAA09542@tbc2.tbcnet.com>  
Rendered body type: text/plain

-- [ From: John B. Leonard \* EMC.Ver #2.5.02 ] --

Just saw on CNN that FAA has approved flight plan for one Claus, S.

Pilot - Claus, S  
Age - Unknown  
A/C Type - Sleigh  
TAS - 350 Kts  
Alt (AGL) - Rooftop height  
Departure Time - When Kid are Asleep  
Departure Point - North Pole

Can we drop the ICBM/Terrorist/Tom C. discussion long enuf to figure out if there's anyway the APRS group can assist the FAA with tracking this flight?

It would probably score some points with public, and give us something ON THE SUBJECT to discuss. Also would be a good drill.

Personally, I would REALLY like to see something coordinated thru the SIG,

as opposed to various fragmented groups. But beggars can't be...well, you know.

73's Barry

## 664. APRS over voice repeaters

From: Randy Hammock <hammock@tis.telos.com>  
Date: Thu, 21 Dec 1995 11:33:13 -0500 (EST)  
To: APRSSIG@tapr.org  
Message-ID: <Pine.SOL.3.91.951221110632.20548A@zentropa>  
Rendered body type: text/plain

I don't know if anyone has done much listening to the public service bands, but it seems that the method used by the PS people for automatic station ID would work for APRS via a voice repeater. This being, each time the officer keys his mic, the ID is sent before he starts talking (do they use digital delay to hold back the voice during ID or does the officer have to wait before speaking). The twist comes in that it seems the ID is sent without PL while voice has PL. I can listen to the Howard County police with CTCSS turned on and hear all the chatter but not the annoying braps of the auto IDs. Maybe I'm just hearing the pickup delay of my PL decoder, but it does seem like a way send data with out annoying the users. Of course the same principle could be applied to a trailing data burst.

## 665. WinAPRS beta

From: sproul@ap.org (Mark Sproul)  
Date: Thu, 21 Dec 1995 11:49:38 -0500  
To: aprssig@tapr.org  
Message-ID: <v02130500acff3971ec11@[165.1.27.20]>  
Rendered body type: text/plain

WinAPRS beta status

As promised, we will be releasing WinAPRS beta by Christmas, however, the first release will be to about a dozen individuals.

We are restricting the first release so that we can keep on top of things for the first try. Once we have had a couple of weeks to get feed back from these people then we will be releasing a general beta version.

Here are a few notes about WinAPRS:

WinAPRS is going far better than I could have even imagined. I have far more features implemented that I expected by time for beta release. The common source implementation with MacAPRS is working out very well. The development environment that I am using, CodeWarrior, which allows me to write, compile, and debug Windows programs from my Mac has been working great.

WinAPRS is a "WINDOWS" application, it is NOT a DOS application, so the user interface follows Windows guide lines.

WinAPRS is a Win32 application. This means that it runs under Windows95 and WindowsNT. To run under Windows3.1, the Win32S DLL will be

required. Win32S is  
free and available off of the internet. See the on-line  
documentation for more  
info about Win32S.

WinAPRS uses the MacAPRS file format AND the DOS-APRS file format.  
This means that  
all of the hi-resolution maps for MacAPRS will work directly AND  
all of the maps  
that have been made by APRS users.

I have started some documentation, it can be seen at  
<http://www.ns.rutgers.edu/~ksproul/APRS/>

We will keep you informed about the progress, keep watching the Web page  
for updates.

Mark Sproul

## 666. ???APRS Auroral-Zone Propagation Study???

From: AA8JK@aol.com  
Date: Thu, 21 Dec 1995 12:21:41 -0500  
To: aprssig@tapr.org  
Message-ID: <951221122141\_96275129@mail04.mail.aol.com>  
Rendered body type: text/plain

Hello,

While looking through the January 1996 QST (looking for the life insurance  
ad) I read "The World Above 50 MHZ" on page 96. The article talks about  
Auroral-Zone Propagation and the possibility of some unusual propagation in  
the Arctic region.

The article states, "It might well be a useful exercise for 2-meter stations  
in the auroral-zone spaced 1000 to 2000 km apart to organize regular tests.  
As has already been demonstrated, low-powered FM stations can be effective  
(over large distances in the Arctic region). This suggests some more  
automatic means, such as packet, could provide an ideal adjunct to  
auroral-zone studies at 144 MHZ and even higher"

I have translated this into the following: APRS, we need your help!

The article further states that there have been some beacons placed up north  
to study the different types of propagation our friends have there. The  
problem with the a normal CW beacon is a person listening to the beacon is  
necessary. As you know, a person can't be listening to all the beacons, all  
the time. Here is where APRS comes to the rescue. Using the Micro Interface  
Module (MIM) and some low cost, low maintenance radios, a study of the Arctic  
propagation would be a great test and a great demonstration of one of the  
many uses of APRS. Studies of different bands could also be done.

I would find it interesting and fun to be part of a study with my favorite  
activity in ham radio being center stage. A project like this one could  
bring out other refinements of APRS. Bob's idea of being able to call a  
computer with APRS running and downloading the different reports (position  
and heard logs) might be something to investigate for remote sites. By  
uploading the same files to the Internet from a dedicated APRS information  
gathering station in the Arctic, even someone in Florida or Nevada could help  
with the study. As with most APRS related ideas, the possibilities are  
endless.

Please read the article and then let me know what you think. Can this be  
done? What might be the limitations? Is there anyone else that might be  
interested? Do we have people from Alaska and/or Northern Canada on the  
APRSSIG?

Thank you for you time.

73,

Steve Caesar AA8JK  
Tri-state APRS Working Group

Rendered body type: text/plain

It appears to me that this sig needs a new topic now that GPS and bombs is slowing. So here goes...

I would like to open a discussion on the topic of APRS information via voice repeaters. Some topics are: What data rate is advisable? Is the repeater being used as a digi, a frequency transponder, or just a powerful transmitter/ sensitive receiver connected to a good antenna that can hear stuff from a long way away? How does one get around the problem that the repeaters are not on the APRS freq in the local area? Does that mean there are multiple APRS freqs in one local area, and they are different from those in the next city over? Well my questions can go on for a while.

What do you think?

>I don't know if anyone has done much listening to the public service

To: aprssig@tapr.org  
Message-ID: <199512211833.NAA01176@camus-s1.delphi.com>  
Rendered body type: text/plain

Hello, all

I like Barrys' idea of a Santa tracking net on APRS. I WOULD be a good way to show off APRS capabilities to the public, etc and have some fun at the same time. Also a good way to introduce kids to Amateur Radio. Coordination thru the SIG seems the best way to go. Someone just need to start uplinking the object and others can grab it and steer Santa to their neighborhood, hi-hi. Bob(APR), is it possible to use(or is there imbedded in APRS an appropriate symbol that we may not be aware of?

To Keith and Mark(MAC/Win APRS): Are MACAPRS and/or WinAPRS using true .ico files to display symbols on the maps? And if so can a user teh create his own .ico to assign to a symbol or add to the symbol list? This would allow users to have a little creativity and personality in their copy of the program and allow custom symbols to be generated for special events, etc.

Happy Holidays to all, and to all a good night.

73, Bob

NNNN

AMEN...this sig has turned into a place for garbage...is there no imagination out there do you all have to continue to be a dead horse.

Come on people take it somewhere else..this is not a free for all and it is really getting tire some for us who really enjoy APRS and it's features. By the way I am familiar with unsubscribe and the delete button. Mine (delete button has been replaced twice because of all the use it gets here on this sig) gets plenty of use here. Oh yes and I have been playing with BOB's invention for over a year and have been a subscriber since its existance (the sig that is) 73 all and have fun you sure know how to destroy something fast..

Message-ID: <2EEEC8E6AC7@avoca.nwsc.sea06.navy.mil>  
Rendered body type: text/plain

Bob has addressed this very subject.

He wrote some words about it for the 1995 ARRL Digital Communications Conference, and also spoke about it at the Hamvention.

I think what will be required is a DCD circuit that will blank the repeater output audio and feed it into a separate transmitter. That way, you don't irritate the voice users.

Rendered body type: text/plain

The only way I have been able to reproduce the BUFFER OVERFLOW error was to program a second PC to output the U-2000 data at 10 reports per second, and then to enter an APRS PROMPT.

Now that I can reproduce the problem, I can work on a solution. But I worked all evening and DO NOT YET HAVE A RELIABLE FIX.

I'm gonna be on XMAS travel, so the FIX will NOT come until early January. Sorry guys..

> transmitter/ sensitive receiver.... What about all the different FREQS?

WB4APR REPLY COMMENT: Whohaaa, All of those questions are answered in APRS\README\VOX-RPTR.txt. There is a TNC at the voice repeater listening on the voice input. It MUTES the voice repeater OUTPUT so users do NOT hear the packet and then it DIGIPEATS the POSIT on the local APRS DIGITAL FREQ. That way EVERYONE that wants to TRACK ANYONE, just monitors the APRS freq. And all mobiles can report their POSITS on their VOICE TRANSCEIVER. The APRS MIC Encoder (avail by Dayton) will interface your GPS to your MIC so that your posit goes out when you release the PTT in a 0.25 sec burst.

Rendered body type: text/plain

WB4APR REPLY COMMENT: All it takes is for someone in each area to put a SANTA OBJECT up in north canada. Use MAPS-PLOTS-RANGE to find out the distance to your QTH. Compute the SPEED necessary to Arrive at your QTH at the right time, and enter a COURSE. APRS will uplink the posit and everyone else will DR it until it arrives. If you want to make it appear more realistic (and for those stations that have DR off), every now and then, you can HOOK and MOVE the object to the DR'ed position.

Of course there are other considerations and the two that I have in mind both have their drawbacks as well as advantages. By sending the POS packet at the end of the transmission, you run in to possibility of someone stepping on the packet through quick keying (I've heard some old HF contesters in the repeater that won't let a millisecond of silence happen). While sending the POS packet in the front of the transmission has the problem, does the operator wait or is a delay line used to time shift the audio to make up for the time of the POS packet? At anyrate we're not discussing guided missiles. dig dig dig And yes, A DCD coupled with a delay line should keep the user from hearing the brack of the POS packet.

## 680. WinAPRS beta

From: sproul@ap.org (Mark Sproul)  
Date: Thu, 21 Dec 1995 15:36:46 -0500  
To: aprssig@tapr.org  
Message-ID: <v02130506acff752758ed@[165.1.27.20]>  
Rendered body type: text/plain

(I hate messages that are hard to read, I really tried to make the last one look correct, but it got messed up any way. So here it is again, this time hopefully, much easier to read)

WinAPRS beta status

As promised, we will be releasing WinAPRS beta by Christmas, however, the first release will be to about a dozen individuals.

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

!!! IMPORTANT

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

We are restricting the first release so that we can keep on top of things for the first try. Once we have had a couple of weeks to get feed back from these people then we will be releasing a general beta version.

By the end of January, we will have a generally available beta for everyone to try.

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!

Here are a few notes about WinAPRS:

1) WinAPRS is going far better than I could have even imagined. I have far more features implemented that I expected by time for beta release. The common source implementation with MacAPRS is working out very well. The development environment that I am using, CodeWarrior, which allows me to write, compile, and debug Windows programs from my Mac has been working great.

2) WinAPRS is a "WINDOWS" application, it is NOT a DOS application, so the user interface follows Windows guide lines.

3) WinAPRS is a Win32 application. This means that it runs under Windows95 and WindowsNT. To run under Windows3.1, the Win32S DLL will be required. Win32S is free and available off of the internet. See the on-line documentation for more info about Win32S.

4) WinAPRS uses the MacAPRS file format AND the DOS-APRS file format. This means that all of the hi-resolution maps for MacAPRS will work directly AND all of the maps that have been made by APRS users.

5) I have started some documentation, it can be seen at  
<http://www-ns.rutgers.edu/~ksproul/APRS/>

We will keep you informed about the progress, keep watching the Web page for updates.

Well, first Macs don't use ".ico" files, but you probably knew that.

Yes, WinAPRS uses ".ico" files, but most of them are already assigned.

BTW, I wrote a program on the Mac to take all of the ICONs we had created for the Mac and write out an ICO file for each one of them, it sure was better than redoing all of the icons (there's almost 200 of them).

Rendered body type: text/plain

Hi all

I am new to the mail list, but have been using APRS for a while. The problem that I am having is with my mobile system (gps/tnc/ht) is sending out positions, and they all get mapped. The old positions are never removed so after I have been driving for a while the whole map gets filled with my station everywhere. Do I have something set up wrong, or is this normal ?

## 683. Re: [APRSSIG:5460] Re: APRS on voice repeaters

From: lmkeeran@ilstu.edu (Larry Keeran)  
Date: Thu, 21 Dec 1995 16:16:15 -0600  
To: aprssig@tapr.org  
Message-ID: <v02120d02acff81b92aee@[138.87.2.109]>  
Rendered body type: text/plain

Our 2M repeater generates output PL (CTCSS) of 103.5 if the input has PL is 103.5 and repeats the input without PL if a carrier squelch (CS) station uses it that way.

And we have had anti-PL installed since 1976. (and written up in 73 about that time -Jan '78) If the dx repeater user on the same frequency transmits his PL tone (107.2 for his area), the local repeater doesn't even key up. The "anti-PL" tone of 107.2 actually opens the PTT circuit. If a local station (someone stronger than the 107.2 DX station) is heard by the repeater, the capture principle applies and the "anti-PL" is defeated - closing the path for PTT to happen normally. This allows for two things: the weak dx repeater user doesn't QRM the locals and the local could point his beam to the dx repeater accessing it without QRMing the local users.

Packet does work thru the repeater nicely. We used it in emergencies for passing ARC traffic where there wasn't digipeaters. You do have to lengthen the lead sync tone (what is it TXD?, been a while) to allow for the keyup delay. And lengthen the other parameter to prevent the reply packet from being sent too quickly before the repeater input noise burst finishes. You don't have to wait for repeater drop, just the unkey burst.

This allows the voice user to keep his transceiver "on PL" and not hear the CS (packet) station. I'll test APRS on our repeater over the next couple of weeks to see the effects and to come back with any critique. Packet \*HAS\* worked so I am not expecting any problems with APRS.

I just got word that 73 mag is doing a special SATELLITE issue for MARCH.

DEADLINE is 22 DEC. Tomorrow!

I need to get a copy of APTRAK.txt to 73 mag ASAP.. CANT FIND AN ADDRESS  
anywhere or EMAIL.

Wife is picking me up in 5 minutes for 2 week trip!

If anyone wants to copy APTRAK.txt, its in the APTRAK\README directory...  
and send it in as an article, I would appreciate it. First persone to  
successfully do so, please tell everyone else so they dont get too many  
copies! THANKS... SORRY TO USE THE SIG, but im outta time...

Interesting discovery. That would explain why it isn't affecting everybody. Those  
of us with a 16550 uart buffer the data because APRS isn't requesting it all the  
time. So when that com port is polled it has several lines of buffered data??  
HUMMMMM let me see if I can figure out how to turn the buffering off on the 16550.  
I used to have a small com that would do that.

73 Bob, and TNX once again

## 692. Change in 2MEG CD?

From: "Antanaitis - Margaret B." <marganta@umd5.umd.edu>  
Date: Thu, 21 Dec 1995 22:25:34 -0500 (EST)  
To: aprssig@tapr.org

Rendered body type: text/plain

- A word of caution to anyone considering buying a 1:2,000,000 USGS CD.
- Several days ago I received my 1:2,000,000-Scale Optional format USGS DLG CD. It is marked as being Mastered 7/95. It is \*NOT\* compatible with MAKEMAP1.BAS. The file structure on the CD is tiered by state rather than region as expected by MAKEMAP1.BAS.
- The DLG data is in files organized by state name (\DATA\DLG\NC\NC2MILRD.DO for North Carolina road information). 4 to 8 files are provided for each state (NC2MILRD.DO, NC2MILHY.DO, NC2MILBD.DO, NC2MILRR.DO, NC2MILMS.DO, NC2MILMT.DO, NC2MILMS.TXT, and NC2MILMT.TXT).
- The respective DLG (.DO) files are structured similar to 1:100K files I have downloaded over the Internet EXCEPT each line of data is terminated ONLY in a linefeed character AND varies in total length. Neither UNBLOCK.BAS nor its variants would process the DLG files due to the variable line lengths.
- After I wrote a new program to unblock the data, I tried using MKMAPHK2.EXE to generate a 16 mile radius map. It did NOT work, although the map center was within the range of the unblocked DLG file. MKMAPHK2.EXE errored off warning that the DLG files did not cover that point.
- Fortunately I found that I COULD process the unblocked DLG file using CONV100C.BAS to produce files usable by MAPFIX18.BAS. A lot of work and not fun but at least I can extract data.
- Also, the CD does not have the USGS XTRACT.EXE program, rather the utility ARCVIEW is provided for viewing the map data. It requires a minimum of 8 Meg of RAM to run (and it won't work with my 4 Megs).
- Unless I really screwed up [ and it wouldn't be the first time ;-) ] it would appear that MAKEMAP will have to be modified to accomodate a different directory structure and possibly a new data format (I am not that familiar with FIELDED data nor QuickBasic to figure out from the existing code what data format is expected). Any help would be appreciated.

Sure! Move APRS to Comm 1 or Comm 2 and move one of the other things to Comm 3! (APRS was \*not\* designed to work with anything other than Comm 1 or 2 --- see the docs)

Rendered body type: text/plain

Try going to the O C T section. Then shut off the AEA and turn it back on if you see the AEA opening screen then you can go back to APRS (hit escape) and re-initialize from APRS. (Alt-S & T). This always works for me...

Go to the README Subdirectory and read AEA.TXT  
Also check the System Subdirectory for the INITAEA.TNC and RESTYORE.TNC

Whoops....

ARRL publishes "QST". They probably will not forward it to Wayne Green, the publisher of "73" Magazine (their competition)

>data burst.

There is some discussion of doing this with APRS in the README files.

With the system you are referring to, the officer usually has to wait before speaking to avoid cutting off the first word in the PTT-ID data burst. Sometimes there is an audio or visual indication of when it's OK to talk. But, more and more users are finding that putting the data burst at the end of the transmission instead of the beginning accomplishes the same thing with out the need for a manual delay.

This would be a pretty easy interface to build up, just a black box that goes between the radio and mic, with connections for TNC audio, and some way to get the TNC to send a posit when the mic is unkeyed. The use of CTCSS here would keep users from hearing the packets.

Jack

To: aprssig@tapr.org  
Message-ID: <951223033733\_97697716@mail02.mail.aol.com>

Rendered body type: text/plain

In a APRSSIG message dated 95-12-20 18:02:52 EST, ke4eer@ro.com wrote:

>OK GERRY I REMEMBER A WHILE BACK YOU WHERE COMPLAINING ABT  
>ITEMS POSTED THAT WHERE OFF TOPIC FOR THE SIG. WHAT DO YOU  
>CALL THIS VERY LENGHTY STORY ABOUT GARBAGE NOTHING TO DO  
>WITH APRS.

etc etc etc (as the complete original message was repeated.)

People, why is it that the whole message has to be copied over and over and over again? I have seen messages with the WX stuff and GPS with ">>>" on each line, some messages going over 100 lines! Since most mailers Re: the original message, why quote over and over? If you need to see the original message just look it up on your system. Let's cut out this crap and just quote the IMPORTANT part of a message, or nothing at all.

Personal to Bill: "If need be to get rid of having to read all this junk i will unsubscribe from the sig." If you feel inclined to unsubscribe, you are not hurting me by doing that, only yourself. Quite an idle threat.

And to all: Have yourself a Merry Merry Christmas, or whatever else should be Merry at this time of the year.

## 712. Bandwidth and excessive quoting in reply messages

From: BOB DERDERIAN <n2iph@mci.newscorp.com>  
Date: Sat, 23 Dec 1995 04:43:07 -0500 (EST)  
To: aprssig@tapr.org  
Message-ID: <199512230943.EAA30219@camus-s1.delphi.com>  
Rendered body type: text/plain

All I can say is HERE, HERE to N9WMM's NOTAL concerning quoting messages in replies.

We(HAMS) of all people should be wiser than to do this, realizing that the group has probably;

- 1.) Read the original message and will know the subject matter. -or-
- 2.) Have deleted the message without reading 'cause they are not interested in the subject.

You wouldn't use this method if you were replying via packet would you? I think not. You would be FLAMED to within an inch of your life!!

All that a reply msg needs to continue the thread on the subject is to have a subject title that will echo the original msg or let the reader know that this is a reply to the original message, after that you are just wasting bandwidth or too lazy to care. Sure the Internet is huge and the bandwidth dwarfs 1200 and 300 baud packet channels but at the rate it is growing it won't be long before non-thinking button-clickers choke it to a snails crawl!

Remember when packet was faster and actually useable, now its filled with so much garbage(kinda the direction this SIG is heading) that it is a waste. I am not referring to the missiles and bombs discussion either. That topic has some merit and some of the contributors are very knowledgeable. If the topic seems off the beaten path to you then DON'T READ IT! That's not too tough is it? Just hold down the CTRL-key and click on all the mail that you DON'T want to read, then hit the delete key and it's outta here!

Happy Holidays to all.

Bob, n2iph

>Bob, N2IPH sent the above original msg.

I have tried to keep out of this discussion, but

PLEASE lets not let this sig group get like the packet BBs's.  
Mine has page after of receipes, civil war info, navy ships news, missing persons, and lord knows what else.  
I only ready a smal fraction of the msg. but it takes 30 minutes sometimes for the packet to list them all. At one time when it was mostly Ham related it would take 5 or 6 minutes to screen print the msg.  
Merry Christmas and a Happy 1996 to all.

During the current debate over what's "on topic" for APRSSIG and what's not, I noticed several comments from folks who get upset by the "off topic" messages because of the cost involved to download them.

If anyone is interested, I run a landline BBS where I have carried the APRSSIG mailing list as a "conference" on the system since its inception. I offer full, free access to the system on the first call with no mandatory subscription fees. The BBS is located in Vienna, VA, and is a local call from most of the Metro DC area, however, I do get calls from all over the country. Even if you are not a local call to the BBS, you might find this to be a more economical solution than your current method of following the sig. If so, you are invited to call 703/207-9622 and give it a try. A "QWK" mail door is available, which allows you to download new messages in compressed format and read them offline.

Personally, I think some of the technical discussions about GPS operation, errors and error correction are quite informative and I don't mind seeing them from time to time. Perhaps we need two mailing lists - one for APRS discussion only, and one for APRS-GPS and other general topics not especially related to APRS itself. Then, when a thread starts to "stray", we can POLITELY ask the participants to move the thread to the other list. That way, those interested can still participate and follow the discussion, and those not can stay focused on the "APRS only" sig.

73,

Jack

Here is the layout for the data logging mode from the Peet Bros. software documentation:

!! indicates start of record  
Current Wind Speed (4 hex digits) in 0.1 KMPH.  
Current Wind Direction (4 hex digits) 0 - 255 ; 0 = North, 40 = East,  
Outdoor Temperature (4 hex digits) in 0.1 degrees F; 0 = 0.0 deg F,  
Long Term Rain (4 hex digits) in 0.01"

Here we go again.

Wx station support - That IS part of APRS, like it or not.

GPS accuracy - Wonderful tutorial information. Cannot understand why anyone interested in APRS would not also be interested in this.

SA and reasons therefore - Same answer as GPS accuracy comment above. It is good to read this technical information so well presented. The rationale for having SA is also useful, since it is something we have to live with in using GPS.

Drifting into the politics of who pays for it, who misuses it (missiles) etc is too far out of line (IMHO). But I'm not going to shout or unsubscribe...

Happy holidays to all.

Gwyn

To: "'aprssig@tapr.org'" <aprssig@tapr.org>  
Message-ID: <01BAD127.FDC9CAE0@lub02.onramp.net>

Why don't you just call Peet Bros and ask for Bill. Peet's literature invites programmers to call for info on the output formats.

Copy of original message follows:

Just an FYI with and imbedded question.

Now for the imbedded question; any clue on how to decode any of them? I'd like to do some visual basic stuff for the U2000 and I've used every search engine on the internet to find any info on the format, I only got a grand total of 10 hits out of 23 different search engines :-)

Datalog Mode

Bob (APR) is on vacation for a few days and I don't know if he will be on  
the SIG during that time. (You have to take long trips on vacation to  
creat new and interesting HST files!)

Beginning about a year ago, Bob was discussing his plan for using voice  
repeaters. His Mic encoder (which has been quite delayed but is coming  
along just fine now) would be used by mobiles on the repeater  
frequencies. A position report can be sent in about .3 second during the  
squellch tail of the repeater. A special TNC at the repeater copies the  
packet position reports, blocks them from being repeated on the repeater  
output, and retransmits them on the local APRS frequency.

Perhaps some hardy soul will make a special archive of the APRS messages  
dealing with this topic.

This type of equipment is going to be available commercially. Count on  
it. I'll defer further comment to APR when he gets back on the net.

73 and happy holidays,  
Gwyn, W1BEL

## 725. More MKMAPKKE tweaks and fixes.

From: KSwaggart@aol.com  
Date: Sat, 23 Dec 1995 18:02:40 -0500  
To: aprssig@tapr.org  
Message-ID: <951223180239\_78152593@emout04.mail.aol.com>  
Rendered body type: text/plain

Another update of MKMAPKKE has been uploaded to  
tapr.org:/tapr/SIG/aprssig/upload

In this update:

Incorporated BLOCKED/UNBLOCKED feature from MKMAPHK2 so an extra step is  
not required when using files downloaded via the Internet.

Reworked the + and - options so they work like the original MKMAPHK1 and  
wont crash as often.

Changed coast and riverbanks to color 11, bright cyan, to conform to  
standard APRS  
colors. Also allows you to delete streams, which a dim cyan, when you are  
paring down  
your map points without affected rivers and coastlines.

Added historical railroad catagories for the old rail buffs. These plot in  
dim orange or dim violet to stand out from normal railroads.

Extracted the date of the map file data and display it and the quad name  
while the map is building so you know how old the map data is. Some of these  
files on my CD ROM show dates of 1974!

I have not been able to add error trapping routines so that it gracefully  
crashes when it gets too many points. Also, have not yet added any loops back  
to the start so you do not have to reenter the same data for the next map.  
These are in the future, I think.

73 & Merry Christmas, and Happy Map Making in the New Year.

Ken, W7KKE

I couldn't agree more. Unfortunately, if anyone has the timerity to suggest that something has strayed off topic, one runs into the "I have the right to do any damn thing I want and you should do what you need to, to deal with it" mentality. A real sense of cooperation, accommodation and consideration, reminiscent of 20 meters. It is equally unfortunate that discussions tend to dichotomize into two syndromes:

1. I got mine, you got a problem? Stick it in your ear.
2. If I don't get my way, I am going to pick up my toys and go home.

Neither is particularly useful. Both are immature.

I've got many many Leica GPS engines for sale. All units are DGPS capable, and some also have phase information output for high accuracy processing. These units are intended for EMBEDDED systems as they are a circuit board with two serial ports. Also for sale are antenna's for the above units. Also for sale numerous MX-4200D units which are basically a packaged version of the above engines without display. They are intended for PC interfacing and have 4 com ports that support RS-232, NMEA, and RS-485?

=====  
His response to my \$\$\$ question, also edited  
=====  
From: jwelter@ibm.net  
To: dvezlez@norfolk.infi.net  
Subject: Re: For Sale!

All are RTCM DGPS ready. We've used them with two big DGPS service providers in the States (DCI and AccuPoint) with 2-5m accuracies...We've also done some phase processing with them and you can expect better then 5ppm if you're careful to maintain lock...Price for the engines is \$100, MX-4200's \$200, Phase option on either is \$50, and a Aircraft TSO'd antenna is \$50.

I've got about 10 engines right now and 8 MX's left. They sell like hotcakes!

## 730. To all the Whiners . . .

From: JeffS5@aol.com  
Date: Sun, 24 Dec 1995 19:04:45 -0500  
To: aprssig@tapr.org  
Message-ID: <951224190444\_23140463@emout06.mail.aol.com>  
Rendered body type: text/plain

I have sat here for 2 weeks listening to all the complaining about who thinks what's important to this SIG (in their opinion). This SIG was founded on APRS. APRS was founded BECAUSE of GPS. GPS was founded in part to get missiles home and on-time. Is this related to APRS? Yes! There is NO ONE on this SIG that's not interested or facinated by the concept of GPS, how it works, and why. GPS is the basic building block of APRS and this SIG. There are newcomers to GPS, APRS, & this SIG constantly signing-on that really don't have a clue how things work, or why. IT'S THESE PEOPLE WHO ARE GONA MAKE APRS FLY IN THE AMATEUR WORLD FOLKS! If Gerry wants to give the long version of how GPS works on missiles, let him! He is, by far more qualified to speak than most who are here. Frankly I enjoyed it!

For those who complain that they're paying for each E-Mail message they receive, I suggest you look around at changing servers. There are PLENTY who charge flat rate for their services. AOL is one if you prefer the giant servers, and Earthlink is another as a WWW provider. Those that can't get local phone access and are paying LD charges, buy a faster modem!

Bottom Line: QUIT COMPLAINING for cryin' out loud!

There's no need to fwd your opinions about who sent what to where and whether or not YOU deem it fit for APRS. If you can't resist complaining, send it direct, but quit complaining to the SIG. We're not interested!

Can't stand it anymore and HAVE to sign-off?: 73 & SEE YA!

I hope you who are doing the whining are just about thru cause I'm getting tired of mass deletes.

Happy Holidays,

Jeff - WA6EQU

>

If you are paying by the message -- you can put any TAPR SIG mailing group  
into what is called digest mode.

Send e-mail to listserv@tapr.org

in the body of the message say

set aprssig digest

This will cause one message a day to be sent containing all the messages  
from the sig that day.

Maybe this will help.

If you are not familiar with how Internet lists work, what has been  
happening on APRS SIG with diverse topics happening at the same time -- this  
is pretty normal. Just press delete if you read something you don't like  
and keep an eye on the subject line.

Merry Xmas and Happy Holidays!

Greg

I am the amateur radio liaison for the SE Michigan office of the National  
Weather Service. This White Lake MI WSFO has the warning responsibilty for  
17 counties in SE lower MI. APRS is one of the reporting systems we give to  
the NWS operators. I am interested in communicating with others amateurs  
that support National Weather Service offices across the nation using APRS.  
Thank you:

John Moore, KD1E  
moore kd1e@aol.com

### 734. This isnt about missiles or flames.

Here is an interesting thing I ran into . Think I should share it with the sig.

I run my KPC on battery mode usually when Im mobile.  
When the battery runs down, the xmit audio becomes unreadable and I know its time to change the 9v battery.

This has become a hassle as I usually am leaving the tracker on.  
Wired up the KPC to the car battery..Left the 9v battery in there.

Come to find out, when the 9V battery runs dead, even with external power applied, the TNC gets moody and xmit audio is garbled.  
Sure enough, take out the battery, (taped up the open 9V connector so it wont touch anything inside) and boom, the tnc works again.  
Therefore...if your having a problem, even when external power is applied, check the 9v battery.  
I duplicated this test with a dead 9v battery on my other kpc 3. Again, it did not work properly, even when external power was applied.

Now I operate without the battery and the lithium keeps the important data.  
73,  
Mike KD4EMI@ AOL.COM

#1 is anyone using aprs on 6 meters?  
And if so, any activity there? I would like to try it on my new 706 but havent heard even a BRAAAP on 6 meters.

#2

There exists these small stamp sized "computers"  
They are great for applications involving analog to digital conversions and have rs232 compatable ports, programable in "basic" and are inexpensive.  
KC4NMY and myself are developing a small stamp that hooks up to a cheap wx radio. For those in area's that dont have APRS wx stations, or  
for possible skywarn applications (without the peet wx station, which doesnt know if a tornado is inbound until its on top of it) this chip will monitor the alert tone on a wx radio.  
When the Radio shack wx beep goes off, indicating a wx emergency, the chip hears this and programs the tnc with a previously decided text. This txt can be set up in aprs format to set off your wx alarms on your computer, or be set up with another tnc/chip that can read the alert, and dial up a beeper list if needed. Your aprs program will  
alert you to a problem, and if your in the car or outside, your beeper could alert you. REMIND you that it is a generic alert, and tells you that bad wx is coming, not the nature of the wx emergency but at least it is another way to remind you to investigate the wx situation.

The cost of an entire kit could be less than \$100.

I (we) need feedback from the sig about how to change this basic premise of operation to better suit their needs.  
What would your specific need be?  
What modification to this basic idea would you suggest?

Thanks in advance. Mike KD4EMI@AOL.COM  
(but please reply in the sig to encourage feedback)

---

### 736. Re: [APRSSIG:5502] Re: Ultimeter 2000

Rendered body type: text/plain

Hi gang.

Here are the details for the Peet Brothers Company's Ultimeter 2000 and Model 500 systems' serial communications. I don't know how this relates to the Ultimeter II.

Enjoy,  
aps.

Armando Stettner  
aps@ieee.org, N1TYG

Communications Details for the Ultimeter 2000 (and 500)  
Abridged by Armando Stettner (N1TYG) from the  
Peet Brothers Company's "Serial Data Specification 12/7/95"

#### Overall Descriptions

-----  
2400 baud, 8 bits, 1 stop bit, no parity. Each byte is a printable ASCII character representing one hex digit. Data is most significant digit first.

There are 4 modes of communications with/from the U2000. Each mode is entered by pressing and holding for 3 seconds, a two key combination. Each mode sends a specific data record with a mode specific header character string.

The enabling key combination, header string and record contents are listed below. In general, the 4 operating modes are:

1. Data Logging mode where data is output continuously. This mode is the default mode for the system.
2. Packet mode, where data is output every 5 minutes.
3. Modem mode, where the U2000 will respond to commands it receives. This appears to be another way to set various configuration parameters.
4. Complete Record mode, where the data is also output continuously. This mode is not available on the Model 500.

#### Data Format and Precision Notes

-----  
Wind speed: 0.1 knots per hour  
Wind direction: 0-255  
Temperatures: 0.1 degrees F  
Rain: 0.01 inches  
Pressures: 0.1 mbar  
Humidity: 0.1%  
Date: day of the year (January 1 = 0)  
Time: minute of the day

The notion of 'today' and 'yesterday' occurs between midnight and midnight. So, today's high is calculated within the range of midnight and the current time.

#### Record Structures

-----  
\*\*\*\* DATA LOGGING Mode \*\*\*\*

Enabling key combination: CLEAR & WIND SPEED for 3 seconds

Header string: '!!' (two exclamation marks, not including the quotation marks)

Record size: 40 hex digits + header, carriage return and line feed.

Record detail:

Element	Data Item	Hex Digits
1	Wind speed	4
2	Wind direction	4
3	Outdoor temp	4
4	Rain	4
5	Barometric pressure	4
6	Indoor temp	4
7	Outdoor humidity	4
8	Indoor humidity	4
9	Date (day of year)	4
10	Time (minute of day)	4
	Carriage Return, Linefeed	4

-----  
 \*\*\*\* Packet Mode \*\*\*\*

Enabling key combination: CLEAR & WIND CHILL for 3 seconds

Header string: '\$ULTW' (not including the quotation marks)

Record size: 44 hex digits

Record detail:

Element	Data Item	Hex Digits
1	Wind speed peak over last 5 min.	4
2	Wind direction of wind speed peak	4
3	Current outdoor temp	4
4	Rain total for today	4
5	Current barometric pressure	4
6	Barometer delta value (0.1 mbar)	4
7	Barometer correction factor (LSW)	4
8	Barometer correction factor (MSW)	4
9	Current outdoor humidity	4
10	Date	4
11	Time	4

-----

\*\*\*\* Modem Mode \*\*\*\*

Enabling key combination: CLEAR & TEMPERATURE for 3 seconds

Header string: '>n' (beginning of each line, where n goes from 'A' to 'K')

Record size: not applicable

Record detail:

Command	Syntax	Hex digits in date
- Set date of year/time of day in minutes	>Addddtttt	4 + 4
- Set wind direction correction factor	>Bwww	3
- Set rain gage increments 0=0.01; 1=0.1	>Ci	1
- Set Barometric correction factor	>Dbbbbbbbb	8
- Set sea level barometric value	>Ebbbbbb	5
- Set leap year value (0-3)	>Fl	1
- Master reset	>G	0
- Send 1 complete record	>H	0
- Set data logging mode	>I	0
- Set Packet mode	>J	
- Set modem mode	>K	

-----

\*\*\*\* Complete Record Mode \*\*\*\*

Enabling key combination: CLEAR & RAIN for 3 seconds

Header string: '&CR&' (including the quotation marks)

Record size: 448 hex digits

Record detail:

Element	Data Item	Hex Digits
1	Windspeed	4
2	Current wind direction	4
3	Wind speed peak	4
4	Wind direction peak	4
5	Wind chill	4
6	Outdoor temp	4
7	Rain total for today	4
8	Barometric pressure	4
9	Barometer delta value	4
10	Barometer Correction Factor (LSW)	4
11	Barometer Correction Factor (MSW)	4
12	Indoor temp	4
13	Outdoor humidity	4
14	Indoor humidity	4
15	Dew point	4
16	Date	4
17	Time	4
18	Low wind chill for today	4

I've gotten a couple of messages like this over the holiday weekend.

We've changed from using TNOS under DOS to a LINUX system (and currently using PINE as a mailer) this past week. Possibly something has gone astray in the setup... the address xxx.csd.uwm.edu looks like something out of the PINE documentation, so it is probably an operator error here.

For the record, addresses:  
gwyn@paccomm.com  
paul@paccomm.com for Paul's personal hobby stuff  
pe@paccomm.com for tech support from Paul

Happy Holidays to all.  
Gwyn, W1BEL

Sounds like you have a bad diode between the battery and the rest of the circuit.

Those wondering about the purpose for, uses of, and history behind APRS are encouraged to read "README.1st" and "HISTORY.txt", along with several other documents that Bob, WB4APR, wrote, in the \README directory in the distribution program. These tell of many uses for the APRS system.

Happy Holidays

Barry Leonard/N9VJQ

Rendered body type: text/plain

If you do this, PLEASE devise a way to handle the routine test by the NWS. The rest of us (wherever we may be) may not be interested in knowing each time your local alert is tested. You'll probably need a somewhat accurate clock to disable your alert for a half hour or so around the time of the test by NWS. We're already getting enough false alarms as it is from other sources.  
Beeper idea is fine, though- as it doesn't bother anyone but your beeper list.

Another thing to watch out for - I have seen several KPC-3's with failing batteries lockup the PTT line, turning on the transmitter and no audio.

Having had our GATE in Salt Lake up on Christmas eve, I was pleased to see that Santa WAS tracked and visible on APRS. My children (9 and 11) were mesmerized, and spent a good portion of the evening running back into the shack to see where Santa was going. They didn't catch on to the fact that his position was fixed until right before bedtime - but it was a wonderful addition to our Christmas here. Whoever uplinked Santa to all of us, THANK YOU!

Happy New Year to all sig readers!

Doug

Subject: [APRSSIG:5457] Santa tracking Net

From: aprssig@tapr.org at Internet-Mail  
Date: 12/21/95 12:57

Hello, all

I like Barry's idea of a Santa tracking net on APRS. I WOULD be a good way to show off APRS capabilities to the public, etc and have some fun at the same time. Also a good way to introduce kids to Amateur Radio. Coordination thru the SIG seems the best way to go. Someone just need to start uplinking the object and others can grab it and steer Santa to their neighborhood, hi-hi. Bob(APR), is it possible to use(or is there imbedded in APRS an appropriate symbol that we may not be aware of?

To Keith and Mark(MAC/Win APRS): Are MACAPRS and/or WinAPRS using true .ico files to display symbols on the maps? And if so can a user tehn create his own .ico to assign to a symbol or add to the symbol list? This would allow users to have a little creativity and personality in their copy of the program and allow custom symbols to be generated for special events, etc.

Happy Holidays to all, and to all a good night.

73, Bob

This is not uncommon to a number of TNC's. Our Club's ancient PK-80 will lock in transmit mode if voltage (or amperage) drops below a certain threshold. This is very apparent when running the unit off the same power supply as the transceiver.

I've also seen incidents where power surges caused by lightning strikes have locked the PTT of TNC's, either through the TNC OR the radio.

John,  
How about a quick synopsis of how you are doing it! We basically have the same responsibility here in the Texas Panhandle with 29 counties. I have been told we have a direct link into AFOS when we are ready. We will probably go with a TexNet system, but are still looking at other ideas. So basically how are you getting info into APRS is my big question.

Thanks in Advance and 73 Ben WS5R Potter County ARES EC DM95cf

John,  
How about a quick synopsis of how you are doing it! We basically have the same responsibility here in the Texas Panhandle with 29 counties. I have been told we have a direct link into AFOS when we are ready. We will probably go with a TexNet system, but are still looking at other ideas. So basically how are you getting info into APRS is my big question.

I think your talkin to me abt this.  
quick synopsis is in next msg.

## 756. How the Wx alert could work

From: KD4EMI@aol.com  
Date: Tue, 26 Dec 1995 22:52:14 -0500  
To: aprssig@tapr.org  
Cc: DM0BLEY@encore.com, 0004818186@mcimail.com  
Message-ID: <951226225213\_99760438@mail04.mail.aol.com>  
Rendered body type: text/plain

I was really supriised at the volume of mail that I received about the aprs wx alert idea. In less than 24 hours I have rec'd 30 messages, private and on the sig about it.

The following is the BASIC idea of what I am thinking. Any comments are not only invited but appreciated. Lets see how we can make this a common goal and I would like to try to get this on line and operating in a way that everyone could use. Heck it might actually save someones life !

Here is the idea....

Postage stamp computers are delightfull little devices that have I/O ports and xmit data in various formats. They can also generate DTMF tones, as well as count cycles and a zillion other little a/d conversion applications.

Simply interface a programmed stamp to the AUDIO output of a wx alert radio. The beep goes off indicating a wx alert. The stamp detects this. The stamp sends data to the tnc, reprogramming it with the already preprogrammed wx beacon. This beacon of course is going to be compatable with the aprs wx beacon format. The tnc sends out the wx alert data. Joe Ham down the street, who is on aprs copies the wx alert and this sets off his alarm on his aprs program. (maybe a better way is to have Bob write a special code to just alert stations that nws wx alarm is active)

Anyway, if your within a certain radius of my (the wx station) station, your alarm goes off also. Further, the DTMF capability of the system allows for beeper paging as well. This system does not decode wx alert specifics, but just alerts aprs users that a wx alert (within a certain radius) has been activated. NWS also tests the wx alert system and this can be detected by the clock on the stamp and a false alarm would not be sent. The test alert is at the same time every day (I will confirm this though) The system wont say...TORNADO COMING or HURRICANE COMING. But will say...HEY GUYS..wake up, somethings going on that you better investigate. This is the basic idea. Now, lets make it better! Give me feedback, lets throw it around, and I will change and modify based on your comments. I hope Ive explained it well enough, if not, just let me know.

One idea I just though of while typing this follows...

There are devices that shut off computers when they detect the EMI (har) spikes of lightning. I could tailor a chip (<\$50.00) that says, LIGHTNING WARNING...INCOMING THUNDERSTORM (great for S FL). This would be broadcast over the aprs local net. There is an idea ! !

I digress...

>The tnc sends out the wx  
>alert data. Joe ham down the street, who is on aprs copies the wx alert  
>and this sets off his alarm on his aprs program.

I may be incorrect in this statement, and please let me know if I am!!! BUT...

I believe it is illegal to allow a NOAA or other NON hams to generate a ham transmission. I know this was gone thru a few years ago with the NOAA broadcasts being connected to local repeaters. Note that you don't see it today with voice repeaters, and I think the reason is that the FCC has deemed this not legal. Sorry.

Paul, WD9ABE

Thus spake KD4EMI@aol.com, splattered hither:  
> activated. NWS also tests the wx alert system and this can be detected by  
> the clock on the stamp and a false alarm would not be sent. The test

Sure that's a good idea? It would make a good test of the system. Also, I don't think they test WX alert every day here, but I may be wrong. I think the NWS postpones/cancels tests if weather conditions are threatening, which might mean that it would filter out a truly valid alarm.

A false alarm is better than no alarm at all in my opinion :-)

## 761. Another KPC-3 problem

From: Bill Northup <northup@sw.stratus.com>  
Date: Wed, 27 Dec 1995 16:28:56 -0500 (EST)  
To: aprssig@tapr.org (Mail-list APRS)  
Message-ID: <199512272128.QAA04666@blackdog.sw.stratus.com>  
Rendered body type: text/plain

Last night I found another problem with the KPC-3 and was wondering if anyone else has seen it. I have been trying to call Kantronics but they are not answering their phone.

I am using the TCN is GPS mode tied to a garman45 gps.

The problem: The TNC started sending the same LT line continuously. In doesn't drop TX - it just sends the same line over and over. I saw what had happened and turned it off prior to reaching the watchdog time. I also know the signal was good because when I turned off the TNC I could hear other stations repeating it.

Has anyone else seen this ?

Bill

This maybe a gray area. The previous discussion of rules related to voice repeaters directly repeating an other radio service, the weather broadcasts.

The amateur digital station should be able to parse the data or tone alerts sent out by the noaa weather service and under his firmware or software control send it out in a new form to amateur stations.

Amateur digital stations should be cautioned against broadcasting this information to the general public.

Many amateur digital and voice stations under automatic control have alarm functions that are transmitted when a sensor is activated.

I see way too many BLN s sent out that are not of interest to amateurs on APRS. One Way Bulletins must be of interest to the Amateur Service. Any thing else is broadcasting. I am sure to see " BLN1 Way to Go 49ers! SuperBowl Winners! ". Broadcasting the results of football games is not legal as a one way transmission.

Gee, I HOPE not or the NOAA Weather monitor that triggered our  
Repeater and put the thing in the "Blue Sky Weather Mode" probably  
was running "unproper" for about 15 years.

Seems the FCC Monitoring Station 30 Miles from our System would have  
sent us a greeting message telling us to stop.

Hmmm.

To: aprssig@tapr.org  
Message-ID: <199512272257.RAA26374@osceola.gate.net>  
Rendered body type: text/plain

I have a 150W commercial Uniden radio here that I have programed up (36ch) with  
50.62. I have the programer for the night (Wed) and it is diffiiclt for me to  
get hold of it very often. My problem with 50.62 is that it is so low in the  
band (SSB portion) that this radio (and many others) will not allow the PLL to  
lock up so far away from the regular FM portion.

I will be able to go that low if and only if I can find someone with the  
modification procedures to make this radio SUPER WIDE BAND. I know that they are  
out there but no one I know in the 2-Way industry has the file. It involves  
changing some diodes capacitors, and rework of some air coils but I do not have  
the specific part numbers.

If anyone else is having this problem with narrow cut LB radios and no one else  
objects can we move up higher in the band like some of the oddball simplex  
frequencies in the 52 or 53 MHz band ? 53.00 53.52 are two off the wall simplex  
frequencies listed in the ARRL Diirectory.

I saw the same thing once right after I first got my KPC-3 and was trying to get it setup. It kept repeating the same line continuously. Even after turning it off and back on, it kept repeating! I had to open it and do a cold reset. I never knew exactly why it happened; it was while I was in the middle of setting parameters, but it hasn't happened since. Did make me kind of nervous for awhile though.

Not correct as far as I know....there are two and only two products from broadcast stations that can be retransmitted on Ham freqs by qualified control operators....retransmission of Shuttle audio and retransmission of NOAA Weather ...provided that the retransmission is not continuous...ie, you cannot hook the audio of NOAA into a ham VHF transmitter and let it run 24 hours a day that way...but you can retransmit warnings...we have one repeater hear that has a NOAA WX Alert radio patched into the repeater, when the tone sounds, the audio locks on for two minutes, allowing for the bulletin, then shuts off....

BTW..this is also the same regulation that allows for retransmission of AFOS text bulletins on packet in real time, which we have also been doing here for some time from the local EM office.

```

Well I asked for comments and I got 'em.

Several wrote the following comments and I have commented on the comments below the comments (are you still with me?) (I am sorry for the size of the message but these comments are important to summarize:

Comment #1 sent to me stated:

-----

<SNIP>

I may be incorrect in this statement, and please let me know if I am!!! BUT....

I believe it is illegal to allow a NOAA or other NON hams to generate a ham transmission. I know this was gone thru a few years ago with the NOAA broadcasts being connected to local repeaters. Note that you don't see it today with voice repeaters, and I think the reason is that the FCC has deemed this not legal. Sorry.

(gee we do this here ! we get wx alerts on the repeater!)

-----

and another stated:

Hi Mike this has been done in the past with several articles in 73 and QST (many years ago) explaining the hard circuit, never as a PIC as you suggest. I think the idea is WONDERFUL but there is one problem...one that none of us can answer and the reason that the discrete circuits never became popular, the LAW! Seems that many complained that this was control of an amateur transmitter by non licensed amateurs, well I am sorry to say that I tend to agree with the past

comments many years ago. The idea is great but those "-----" did have a point, unless the FCC has made a waiver, or will, think the PIC idea will be violating the law as was pointed out years ago.

Now if a few stations did it and no one complained I think you could "get away" with it, but if it becomes popular like it could very well become (it is a great idea) I would worry. If you draw attention to yourself (like getting a lot of

APRS users doing the same thing) they will (FCC) wake up and take notice and you may not want the wrath of the FCC coming down on you for such a noble idea.

Call the ARRL Legal Department, or maybe even the FCC and ask for their opinion before you go too far and get disappointed. You may be lucky and they laws may have been changed since to allow this type of operation.

-----  
And yet another stated:

This maybe a gray area. The previous discussion of rules related to voice repeaters directly repeating an other radio service, the weather broadcasts.

The amateur digital station should be able to parse the data or tone alerts sent out by the noaa weather service and under his firmware or software control send it out in a new form to amateur stations.

Amateur digital stations should be cautioned against broadcasting this information to the general public.

Many amateur digital and voice stations under automatic control have alarm functions that are transmitted when a sensor is activated.

( I like this guy ! )

-----  
Now my turn:

I am concerned about the issues raised in these comments.  
As every good amateur has a FCC rule book, I will refer to my latest edition ARRL publication "THE FCC RULE BOOK" and I quote:

Chapter 7-2

(again this is verbatim)  
" You may, however, retransmit NOAA wx broadcasts, propagation bulletins originated by US government stations, and space shuttle communications (with NASA OKAY) as an incident to normal amateur activity."  
Chapter 7-5

QUTOED  
"Radio amateurs may only retransmit signals originating in the Amateur radio service, EXCEPT IN CASES OF EMERGENCY OR COMMUNICATIONS on NASA" <SNIP>  
<SNIP>  
and NOAA wx and governmental propagation bulletins.  
Such transmissions must be limited to an occasional basis"

I wont be ( LOOK AT THE KEYWORD) RETRANSMITTING  
NOAA. My sensor will activated at a NOAA alert and XMIT a beacon.  
Further.  
The transmissions are occasional. Im not constantly retransmitting the NOAA wx station like a repeater ! It is occasionally xmitting a packet beacon, activated by a sensor.

Frankly I was pleased at the pleasant and conscientious way that those hams alerted us to a potential problem and how this didnt get into a flame war. Well done gentleman...  
Id like to thank those who expressed their concerns.  
NOW, LETS GET BACK TO THE BENCH AND BACK TO WORK !!  
Please continue to ponder the comments on the SIG and lets keep it the momentum moving forward....

73 Mike KD4EMI@AOL.COM

To the station looking for GATEWAYS for a NH to ?? trip:

Mark, W02J, runs a multimode station which includes U-II, MAC, &  
a GATE on 145.79-MHz from Readington NJ (Hunterdon Co) which  
is just a tad bit NE of Flemington NJ. I think his GATE is on the  
"standard 10.151" and does a mighty fine job of letting the rest of  
us down here in South Jersey see what's happening in the rest of  
the USA. I think its IDENT is W02J-1. His location is on the maps!

>  
>  
>Bill, we have several units in the Cleveland Ohio area doing this same  
thing on a regular if not daily basis. seems to be triggered at 00:00 z if my  
memory serves me correctly. Three of us here have Garmin 45's tied to  
KPC-3 units as you do. The timing on intervals did not seem to make a  
difference. I will get back into it if someone else has any Idea's but we  
gave up... We have our beacons staggered at 2-3 min intervals for mobile  
tracking, and one will do long tx as you say, as soon as it is done, another  
will start and repeat the process as fast as the digipeater clears.  
We set for sometimes one interval, sometimes 2 intervals with  
different digi paths. At present, we have the units set up as APRS inits.  
so that we can plug and unplug the computer at will, without upsetting  
normal veh broadcast mode. In this mode APRS doesn't tx, but does rx, and  
places position on map from digi echo. We do have all of our beacon  
intervals ref 00:00z may have something to do with it but does seem to be a  
kpc-3 glitch. GPS talks to TNC all the time without recabling. We gave up  
solving prob over hear but maybe someone can help. I can provide alot more  
absolute setting data, but most is out of KPC-3 book or APRS docs.  
Lets see who else responds.... 73... Doug KB8GVQ

I saw the original message, but did not reply....but...

I don't understand! Why would you want to know where the GATE stns are?  
If you are near one (and something comes thru) you'll hear it! A GATE, by  
definition, has an alias of GATE, so you don't need to know its call.

I just received a new Eagle ACCUNAV Sport GPS unit for Christmas. I have  
one question so far, which is, What is the max SOG (speed over ground)  
that this unit will track. I know the Magellan will do around 950 miles  
per hour. Thank you for you help in advance and I am sure I will have more  
when it comes to hooking the unit up to one of the KPC-3 TNC's I have.

>APRS. One Way Bulletins must be of interest to the Amateur Service. Any  
>thing else is broadcasting. I am sure to see " BLN1 Way to Go 49ers!  
>SuperBowl Winners! ".

I will say "Amen" to this. I haven't ever seen the 49ers message, but have been noticing a lot of others.

I've been home several days on a long vacation with nothing better to do, so I have really been watching APRS heavily.

There has been a bulletin for days advertising that a certain APRS group is now on the WWW. There were also sports scores. And beacons of persons home stations (not even WX equipped). This stuff seems endless. It is usually transmitted GATE,WIDE,WIDE, or even WIDE,GATE,GATE,WIDE,WIDE .

If a group has an announcement ie: "APRS74z is now on TAPR" or whatever, then fine. A message sent for a few minutes is sufficient, in my opinion.

I'm glad that the group mentioned above is on the WWW and that they are proud of their team, but it must certainly clog up HF- especially since it is so noticable here on on VHF.

Please keep the sports scores local and off the GATEways please. I have ESPN for that.

And on the subject of this, I see lots of unacked messages flying around on HF. There was one today: Someone was sending his web page address to someone else. As sometimes happens in APRS messaging, the guy started typing his message in the place where the call sign was supposed to go. So he ended up sending his transmission to a callsign of WWW. This message flew around for at least half an hour, with a GATE,WIDE,WIDE tacked onto it. I even thought of changing my call to WWW so it would ack ;)

I am not addressing the legality of this, only the courtesy of controlling your messages properly. When you put something out, make sure it goes where it is supposed to, or is cancelled. No wonder HF is clogged up. I usually take the easy way out and turn on the gate filter. It saves my P List spots but unfortunately does nothing to relieve the congestion!

Happy new year

Ralph

Rendered body type: text/plain

Here is a little tid bit to consider.

I have a rain gauge sold under the name RainWise by Austin Amateur supply (bought a few years ago) and don't want to pay \$100 for a Peet rain gauge for the U2000. I found out that the U2000 (and probably the UII also) use a 4 conductor modular connector for the rain gauge, where only the two center pins are actually used. The Peet rain gauge apparently merely momentarily shorts those contacts as another increment of rain is reached.

So...I used a 330 ohm resistor across the contacts to verify this operation. I measured the open circuit voltage at 5v, and with the 330 ohm resistor at 0.15 v. I conclude that this is a logic input with a 10k or 100k pull up resistor inside the U2000.

Conclusion: Go ahead and use your brand X rain gauge by connecting it in correctly, or maybe make your own!

Paul, WD9ABE  
Maybe closer to GLNTC than anybody (5 miles)

While assembling a tracker we had a similar situation occur when the KPC-3 was accidentally put in the TRANSPARENT mode while connected remotely. Everything coming in from the GPS went right out to the radio. The watchdog timer did not interrupt the transmission. We called Kantronics and they led us to believe they'd disable the Trans command when in GPS mode in the next ROM update. I don't know if this is what's happening to you but I thought it was worth mentioning.

 Rendered body type: text/plain

I am glad to see that I am not crazy seeing these TX bursts. There appears to be a fair number that have seen this problem.

To answer a few question:

I have seen this happen 3 times. Twice while out on the road and noticed the TX light on and turned the kpc-3 off. If you turn it back on it will start TX again. If you leave it off for a minute and turn it back on it functions properly.

The last time it happened while my truck was sitting in the driveway. I was going to change some parameters in the TNC (via myremote) so I left the TNC and radio on, but the the GPS was off. It had been sitting there for about an hour. This tells me that the GPS was not doing something to start it.

I never noticed what time it started but it WAS always early evening so it could have been at 00:00:00Z.

The BLT line I have been using is  
 BLT 1 EVERY 00:02:30 START 00:00:00

QUESTIONS:

1) Of the people that have seen this did everyone have a start time set ?

2) If so was it 00:00:00 ?

Tonight I will leave it on and see if this problem starts at 00:00:00Z. If it does I will change BLT to not specify a start time and see if it happens again tomorrow night.

LAST: I am reading this via digest (for time management reasons) so if anyone wants to get my attention without a day delay - send mail direct.

thanks all

Bill

## 784. The results of Wx investigation are in.

From: KD4EMI@aol.com  
Date: Thu, 28 Dec 1995 12:33:54 -0500  
To: aprssig@tapr.org  
Cc: 0004818186@mcimail.com  
Message-ID: <951228123353\_100839691@emout04.mail.aol.com>  
Rendered body type: text/plain

I spoke via LL to ARRL Norm Bliss, who is responsible to  
regulatory issues there.  
He was typing a Email back to me, when I recieve it I will  
post it here.

Those of you who have not been following, this concerns the issue of  
activating a tnc to retransmit a aprs wx alert upon reciept of a  
NWS wx alert tone.

I'll tell you up front it is confusing, and I am dissapointed but the  
law is the law and here it is.

If the radio transmits because it heard the NWS alert, then its  
NOT legal.  
(now read carefully...Im still shaking my head)

If I normally make beacon transmissions, let's say every 9 minutes,  
and the alert tone simply changes the text of my beacon this is ok.  
But, if the tones cause me to change the timing of the beacon,  
(in otherwords step up the time to more frequently or immediate)  
then it's NOT legal.

So here we are, Now in S. Florida that would not be a big issue,  
9 minutes wont make a diff. but in Tornado alley, 9 minutes is too long to  
wait. So, if a NWS alert occured just after a beacon transmission, you would  
have to wait 9 minutes.  
I think this effectivily demasculates the program idea and Im  
short on cures to fix it.

Therefore, development on this project is now over.  
I will provide the text of the ARRL response to the sig when I get it  
(should be later today)

Id like to thank those of you who alerted me to the potential of  
violating FCC rules and appreciate the help from all.  
73 Mike  
KD4EMI@AOL.COM

## 785. WX Alerts (fwd)

From: Greg Jones <wd5ivd@tapr.org>  
Date: Thu, 28 Dec 1995 12:30:53 -0600 (CST)  
To: aprssig@tapr.org (BBS SIG mailing)  
Message-ID: <199512281830.MAA01696@sys1.tapr.org>  
Rendered body type: text/plain

Hi gang.

Based on the NWS strand the other day I passed the message along to Paul  
Newland, AD7I. This is what Paul sent back ...there is a second message  
regarding the tone issue.

Some very interesting comments...that why I thought it would be good to  
share back with the SIG.

Cheers - Greg, WD5IVD

Forwarded message:

From: Paul.Benjamin.Newland@att.com

Date: Wed, 27 Dec 1995 16:10:21 -0500

Subject: WX Alerts

Reply-To: paul.newland@att.com (Paul Newland)

Greg --

Thanks for the stuff attached. The concept is a good one, however the current NOAA WX alert system is serious dog breath, which makes implementing the idea a big problem. This will be fixed as the old NOAA system is replaced by the new EAS/EBS system (same system for broadcast will be used by NOAA as I understand it).

The problem with the current NOAA system is that there is only one audio alerting tone (sustained goofy dual tones). And it's repeated once every broadcast cycle (about 10 minutes). I have a WX RX with alerting tone decoder at home. When it goes off the first time that's fine -- I get useful data. However when it goes off again another 10 minutes after that and again another 10 minutes after that, etc, etc, it gets to be a serious problem. One could modify the decoding algorithm such that when a decode tone is detected, any further tones will be ignored unless the tone has not been detected in the last 30 minutes. However, then one is vulnerable to having the voice message updated with new data and missing it because the alert tone continued to be broadcast every 10 minutes.

In the new alerting system (called EAS -- Emergency Alerting System if I remember right), data are transmitted via AFSK (goofy tones at goofy baud rate to make it harder for someone to implement an EBS system that looks like the president has just fired the nukes -- in fact, i think a good programmer with a sound card can still create this "nukes" signal if they choose to invest the time to do so). Each new message will have a new sequence number (so that once you get a message error free you can ignore the repeats -- like NAVTEX) and it will include some content about the nature of the warning, location of the affected area (counties are the main units of area and are further subdivided into 9 sub-areas (like a tic-tac-toe board, squished and stretched to fit the county, I think each county administration defines the sub areas within their own county)).

About the best we can do with the current system is to detect the alert tones and then advise people to monitor the audio from NOAA WX radio. The ham alert should be sent out whenever the tone is now present but hasn't been present for the preceeding 30 minutes.

A better alternative might be to simply wait for the new EAS system to come on line and make use of the better data messaging capability of that system. A very cool think would be to have NOAA WX radio do some data under voice on their VHF transmitters. Consider them doing direct FSK of their VHF transmitters at +/-750 Hz 100 baud (sounds like 50 Hz). Shoot, that's no more obnoxious than PL tones. Encoding could be fancy using Reed-Soloman coding or just use SITOR FEC (it's error correcting, cheap, and there are a lot of decoders in the field!).

I will see what I can find on the specs for the new EAS system. The specs that I've seen still have some ambiguities. I wrote to ARRL HQ to see if they could get some info but I don't think they have good connections with the people actually doing this work within the government (which is now closed :(

Paul

Greg

\* \* \* \* \*

I was really suprised at the volume of mail that I received about the aprs wx alert idea. In less than 24 hours I have rec'd 30 messages, private and on the sig about it.

The following is the BASIC idea of what I am thinking. Any comments are not only invited but appreciated. Lets see how we can make this a common goal and I would like to try to get this on line and operating in a way that everyone could use. Heck it might actually save someones life !

Here is the idea....

Postage stamp computers are delightfull little devices that have I/O ports and xmit data in various formats. They can also generate DTMF tones, as well as count cycles and a zillion other little a/d conversion applications.

Simply interface a programmed stamp to the AUDIO output of a wx alert radio. The beep goes off indicating a wx alert. The stamp detects this. The stamp sends data to the tnc, reprogramming it with the already preprogrammed wx beacon. This beacon of course is going to be compatable with the aprs wx beacon format. The tnc sends out the wx alert data. Joe ham down the street, who is on aprs copies the wx alert and this sets off his alarm on his aprs program. (maybe a better way is to have Bob write a special code to just alert stations that nws wx alarm is active)

Anyway, if your within a certain radius of my (the wx station) station, your alarm goes off also.

Further, the DTMF capability of the system allows for beeper paging as well.

This system does not decode wx alert specifics, but just alerts aprs users that a wx alert (within a certain radius) has been activated. NWS also tests the wx alert system and this can be detected by the clock on the stamp and a false alarm would not be sent. The test alert is at the same time every day (I will confirm this though)

The system wont say...TORNADO COMING or HURRICANE COMING.

But will say...HEY GUYS..wake up, somethings going on that you better investigate. This is the basic idea. Now, lets make it better!

Give me feedback, lets throw it around, and I will change and modify based on your comments.

I hope Ive explained it well enough, if not, just let me know.

One idea I just though of while typing this follows...

There are devices that shut off computers when they detect the EMI (har) spikes of lightning. I could tailor a chip (<\$50.00) that says, LIGHTNING WARNING...INCOMING THUNDERSTORM (great for S FL). This would be broadcast over the aprs local net. There is an idea ! !

I digress...

Mike

## 786. EAS Background (fwd)

From: Greg Jones <wd5ivd@tapr.org>  
Date: Thu, 28 Dec 1995 12:34:17 -0600 (CST)  
To: aprssig@tapr.org (BBS SIG mailing)  
Message-ID: <199512281834.MAA02061@sys1.tapr.org>  
Rendered body type: text/plain

Here is the second message regarding a new tone system being developed. This contains two items. Paul's comments to a PRM and the PRM.

Amendment of Part 73,	)	F0 Docket 91-301
Subpart G, of the Commission's	)	F0 Docket 91-171
Rules Regarding the	)	
Emergency Broadcast System	)	

The PRM is very interesting reading and I believe ties in with what was being discussed.

Cheers - Greg, WD5IVD

From: Paul.Benjamin.Newland@att.com

Subject: EAS Background  
Reply-To: paul.newland@att.com (Paul Newland)

Iss 1. January 14, 1995

Comments of Paul Newland regarding the

Emergency Alerting System specification as described in Amendment of Part 73, Subpart G, of the Commission's Rules Regarding the Emergency Broadcast System, FO Docket 91-301, FO Docket 91-171, REPORT AND ORDER AND FURTHER NOTICE OF PROPOSED RULE MAKING (Adopted: November 10, 1994, Released: December 9, 1994), Subpart B - Equipment Requirements:

Section 11.31(a)(1)

-----  
Data rate of 520.83 is stated without a tolerance. Is the tolerance 1% like a teleprinter start/stop asynchronous framing format or is it 30 ppm like that use for synchronous Maritime Digital Selective Calling? No tolerance for audio tones indicated in this section. The first time a value appears it's tolerance should also be stated. The statement "Mark and space time must be 1.92 milliseconds" is redundant with data rate but if it stays it should be changed to "The duration of mark and space symbols shall be in multiples of 1.92 milliseconds +/- X percent [or PPM]."

Section 11.31(b)

-----  
This section implies that the term "backslash" is represented by the symbol "/". I believe the term backslash is more commonly associated with the symbol "\" (ASCII bit pattern 5C (base 16)). More clarity needs to be applied to this section. I truly do not know if "/" (ASCII 2F (base 15)) or "\" (ASCII 5C (base 16)) is intended for use as a separator between call sign and the "FM" or "TV" qualifier.

Section 11.31(c)

-----  
PREAMBLE -- In just looking at this off the top of my head it's not totally clear to me that this bit pattern will always ensure synchronization (at the end I make the point that synchronization issues are not discussed in this spec) if asynch framing is used.

In the examples it's not readily apparent what fields are variable and what fields are fixed. For example, it's appears that [PREAMBLE], "ZCZC", "-", and "+" are fixed fields and in particular are fixed with those values, while "ORG", "EEE", "PSSCCC", "TTTT", "JJJHMM" and "LLLLLLLL" are variable fields which in some cases are constrained to a particular set of values.

Section 11.31(a)(8)

-----  
Sloppy wording. Change "outside 200 Hz..." to "outside the range of 200 Hz..."

Section 11.31(i)

-----  
Sloppy wording. Change whole thing to "Alerting Tone Frequencies. The altering audio tones shall have fundamental frequencies of 853 and 960 Hz +/- 0.5 Hz."

OPEN or UNCLEAR ISSUES

- 
1. What is the absolute modulation/deviation level of the alerting and mark/space tones?
  2. What's the tolerance of that level?
  3. How much relative difference in amplitude is allowed between the low and high frequency components of the alerting tone?
  4. How much relative difference in amplitude is allowed between the mark and space tones of the data signal?
  5. Should these be specified only at audio base band? Most systems state deviation/modulation to ensure that someone hasn't fouled the pre-emphasis.
  6. how are the data words blocked for transmission (how does a receiver know where one data word ends and the next begins)? is the transmission totally synchronous, and the only framing information must be derived from the preamble? or is teleprinter stop/start framing used? if so,

#### I. SUMMARY

1. By this action, we establish the Emergency Alert System (EAS), which will replace the existing Emergency Broadcast System (EBS). We require broadcast stations and cable systems to install and operate new equipment for national alerts while relaxing some requirements for noncommercial educational Class D FM stations and low power television stations. Satellite, Direct Broadcast Satellite (DBS), telephone and cellular carriers, and other service providers are encouraged to voluntarily participate. A standard protocol and new digital codes are adopted that will facilitate different technologies using the new system. Finally, procedures are streamlined so that more participants can work together effectively during emergencies.

2. In a Further Notice of Proposed Rule Making ("FNPRM") we seek comment on how services such as the Multipoint Distribution Service (MDS), Satellite Master Antenna Television (SMATV), and Video Dial Tone should participate in the new EAS. We also seek further comment on whether we should waive our EAS requirements for a defined class of "small" cable systems.

[...]

#### Subpart B - Equipment Requirements

- 11.31 EAS protocol.
- 11.32 EAS Encoder.
- 11.33 EAS Decoder.
- 11.34 Acceptability of the equipment.
- 11.35 Equipment operational readiness.

[...]

#### Subpart B - Equipment Requirements

- 11.31 EAS protocol.
- (a) The EAS uses a four part message for an emergency

activation of the EAS. The four parts are: Preamble and EAS Header Codes; audio Attention Signal; message; and, Preamble and EAS End Of Message (EOM) Codes.

(1) The Preamble and EAS Codes must use Audio Frequency Shift Keying at a rate of 520.83 bits per second to transmit the codes. Mark frequency is 2083.3 Hz and space frequency is 1562.5 Hz. Mark and space time must be 1.92 milliseconds. Characters are ASCII seven bit characters as defined in ANSI X3.4-1977.

(2) The Attention Signal must be made up of the fundamental frequencies of 853 and 960 Hz. The two tones must be transmitted simultaneously. The Attention Signal must be transmitted after the EAS header codes.

(3) The message may be audio, video or text.

(b) The ASCII dash and plus symbols are required and may not be used for any other purpose. Unused characters must be ASCII space characters. FM or TV call signs must use a backslash ASCII character (/) in lieu of a dash.

(c) The EAS protocol, including any codes, must not be amended, extended or abridged without FCC authorization. The EAS protocol and message format are specified in the following representation. Examples are also provided in the EAS Operating Handbook.

---

```
[PREAMBLE]ZCZC-ORG-EEE-PSSCCC+TTTT-JJJHHMM-LLLLLLLLL-
(one second pause)
[PREAMBLE]ZCZC-ORG-EEE-PSSCCC+TTTT-JJJHHMM-LLLLLLLLL-
(one second pause)
[PREAMBLE]ZCZC-ORG-EEE-PSSCCC+TTTT-JJJHHMM-LLLLLLLLL-
(at least a one second pause)
(transmission of 8 to 25 seconds of Attention Signal)
(transmission of audio, video or text messages)
(at least a one second pause)
[PREAMBLE]NNNN
(one second pause)
[PREAMBLE]NNNN
(one second pause)
[PREAMBLE]NNNN
(at least one second pause)
```

---

[PREAMBLE] This is a consecutive string of bits (sixteen bytes of AB hexadecimal[8 bit byte 10101011]) sent to clear the system, set AGC and set asynchronous decoder clocking cycles. The preamble must be transmitted before each header and End Of Message code.

ZCZC- This is the identifier, sent as ASCII characters ZCZC to indicate the start of ASCII code.

ORG- This is the Originator code and indicates who originally initiated the activation of the EAS. These codes are specified in paragraph (d) of this section.

EEE- This is the Event code and indicates the nature of the EAS activation. The codes are specified in paragraph (e) of this section. The Event codes must be compatible with the codes used by the NWS Weather Radio Specific Area Message Encoder (WRSAME).

PSSCCC- This is the Location code and indicates the geographic area affected by the EAS alert. There may be 31 Location codes in an EAS alert. The Location code uses the Federal Information Processing System (FIPS) numbers as described by the U.S. Department of Commerce in National Institute of Standards and Technology publication 772. Each state is assigned an SS number as specified in paragraph (f) of this section. Each county is assigned a CCC number. A CCC number of 000 refers to an entire State or Territory. P defines county subdivisions as follows: 0 = all or an unspecified portion of a county, 1 = Northwest, 2 = North Central, 3 = Northeast, 4 = West Central, 5 = Central, 6 = East Central, 7 = Southwest, 8 = South Central, 9 = Southeast. Other numbers may be designated later for special applications. The use of county subdivisions will probably be rare and generally for oddly shaped or unusually large counties. Any subdivisions must be defined and agreed to by the local officials prior to use.

+TTTT- This indicates the valid time period of a message in 15 minute segments up to one hour and then in 30 minute segments beyond one hour; i.e., +0015, +0030, +0045, +0100, +0430 and +0600.

JJJHHMM- This is the day in Julian Calendar days (JJJ) of the year and the time in hours and minutes (HHMM) when the message was initially released by the originator using 24 hour Universal Coordinated Time (UTC). These codes must remain unchanged for retransmitted messages.

LLLLLLLL- This is the call sign or other identification of the broadcast station, or NWS office transmitting or retransmitting the message. These codes will be automatically affixed to all outgoing messages by the EAS encoder.

NNNN This is the End of Message (EOM) code sent as a string of four ASCII N characters.

(d) The only originator codes are:  
Originator

Emergency Action  
Notification Network

Primary Entry Point  
System

National Weather Service

Civil authorities

Broadcast station  
or cable system  
ORG Code

EAN

PEP

WXR

CIV

#### 11.32 EAS Encoder.

(a) EAS Encoders must at a minimum be capable of encoding the EAS protocol described in 11.31 and providing the EAS code transmission requirements described in 11.51. EAS encoders must additionally provide the following minimum specifications:

(1) Encoder programming. Access to encoder programming shall be protected by a lock or other security measures and be configured so that authorized personnel can readily select and program the EAS Encoder with Originator, Event and Location codes for either manual or automatic operation.

(2) Inputs. The encoder shall have two inputs, one for audio messages and one for data messages (RS-232C with standard protocol and 1200 baud rate).

(3) Outputs. The encoder shall have two outputs, one audio port and one data port (RS-232C with standard protocol and 1200 baud rate).

(4) Calibration. EAS Encoders must provide a means to comply with the modulation levels required in 11.51(f).

(5) Day-Hour-Minute and Identification Stamps. The encoder shall affix the JJJHHMM and LLLLLLLL codes automatically to all initial messages.

(6) Program Data Retention. Program data and codes shall be retained even with the power removed.

(7) Indicator. An aural or visible means that is activated when the Preamble is sent and deactivated at the End of Message code.

(8) Spurious Response. All frequency components outside 200 to 4000 Hz shall be attenuated by 40 dB or more with respect to the output levels of the mark or space frequencies.

(9) Attention Signal generator. The encoder must provide an attention signal that complies with the following:

(i) Tone Frequencies. The audio tones shall have fundamental frequencies of 853 and 960 Hz and not vary over 0.5 Hz.

(ii) Harmonic Distortion. The total harmonic distortion of each of the audio tones may not exceed 5% at the encoder output terminals.

(iii) Minimum Level of Output. The encoder shall have an output level capability of at least +8 dBm into a 600 Ohm load impedance at each audio tone. A means shall be provided to permit individual activation of the two tones for calibration of associated systems.

(iv) Time Period for Transmission of Tones. The encoder shall have timing circuitry that automatically generates the two tones simultaneously for a time period of not less than 8 nor longer than 25 seconds. NOTE: Prior to July 1, 1995, the Attention Signal must be at least 20 and not more than 25 seconds.

(v) Inadvertent activation. The switch used for initiating the automatic generation of the simultaneous tones shall be protected to prevent accidental operation.

(vi) Indicator Display. The encoder shall be provided with a visual and/or aural indicator which clearly shows that the Attention Signal is activated.

(b) Operating Temperature and Humidity. Encoders shall have the ability to operate with the above specifications within an ambient temperature range of 0 to +50 degrees C and a range of relative humidity of up to 95%.

(c) Primary Supply Voltage Variation. Encoders shall be capable of complying with the requirements of this section during

a variation in primary supply voltage of 85 percent to 115 percent of its rated value.

(d) Testing Encoder Units. Encoders not covered by 11.34(e) of this part shall be tested in a 10 V/m minimum RF field at an AM broadcast frequency and a 0.5 V/m minimum RF field at an FM or TV broadcast frequency to simulate actual working conditions.

#### 11.33 EAS Decoder.

(a) An EAS Decoder must at a minimum be capable of decoding the EAS protocol described in 11.31, provide the EAS monitoring functions described in 11.52, and the following minimum specifications:

(1) Inputs. Decoders must have the capability to receive at least 2 audio inputs from EAS monitoring assignments, and one data input (RS-232C with standard protocol and 1200 baud rate). The data input may be used to monitor other communications modes such as Radio Broadcast Data System (RBDS), NWR, satellite, public switched telephone network, or any other source that uses the EAS protocol.

(2) Valid codes. There must be a means to determine if valid EAS header codes are received and to determine if preselected header codes are received.

(3) Storage. Decoders must provide the means to:

(i) Record and store at least two minutes of audio or text messages.

(ii) Store at least 10 preselected header codes for comparison with incoming header codes. A non-preselected header code that is manually transmitted must be stored for comparison with later incoming header codes. The header codes of the last ten received valid messages which still have valid time periods must be stored for comparison with the incoming valid header codes of later messages. The header codes will be deleted from storage as their valid time periods expire.

(4) Display. A visual message shall be developed from any valid EAS header codes received. The message will include the Originator, Event, Location, the valid time period of the message and the local time the message was transmitted. The message shall be in the primary language of the broadcast station or cable system and be fully displayed on the decoder and readable in normal light and darkness.

(5) Indicators. EAS Decoders must have a distinct aural or visible means to show that it is activated when:

(i) any valid EAS header codes are received as specified in 11.33(a)(10).

(ii) preprogrammed header codes, such as those selected in accordance with 11.52(d) are received

(iii) a signal is present at each audio input that is specified in 11.33(a)(1).

(6) Program Data Retention. The program data must be retained even with power removed.

(7) Outputs. Decoders shall have the following outputs: a data port or ports (RS-232C with standard protocol and 1200 baud rate) where received valid EAS header codes and received preselected header codes are available; one audio port that is capable of monitoring each decoder audio input; and, an internal speaker to enable personnel to hear audio from each input.

(8) Decoder Programming. Access to decoder programming shall be protected by a lock or other security measures and be configured so that authorized personnel can readily select and program the EAS Decoder with preselected Originator, Event and Location codes for either manual or automatic operation.

(9) Reset. There shall be a method to automatically or manually reset the decoder to the normal monitoring condition. If an end of message code (EOM) is not received for an EAS message, operators shall be able to select an automatic reset time which may not be less than two minutes. Messages received with the EAN Event codes shall disable the reset function so that lengthy audio messages can be handled. The last message received with valid header codes shall be displayed as required by 11.33(a)(4) of this section before the decoder is reset.

(10) Message Validity. An EAS Decoder must provide error detection and validation of the header codes of each message to ascertain if the message is valid. Header code comparisons may be accomplished through the use of a bit-by-bit compare or any other error detection and validation protocol. A header code must only be considered valid when two of the three headers match exactly. Duplicate messages must not be relayed automatically.

(11) A header code with the EAN Event code specified in 11.31(c) of this part that is received through either of the two audio inputs must override all other EAS messages.

(b) Attention Signal. EAS Decoders at broadcast stations shall have detection and activation circuitry that will demute a receiver upon detection of the two audio tones of 853 Hz and 960 Hz. To prevent false responses, decoders designed to use the two tones for broadcast receiver demuting shall comply with the following:

(1) Time Delay. A minimum time delay of 8 but not more than 16 seconds of tone reception shall be incorporated into the demuting or activation process to insure that the tones will be audible for a period of at least 4 seconds. After July 1, 1995, the time delay shall be 3-4 seconds.

(2) Operation Bandwidth. The decoder circuitry shall not respond to tones which vary more than 0.5 Hz from each of the frequencies, 853 Hz and 960 Hz.

(3) Reset Ability. The decoder shall have a means to manually or automatically reset the associated broadcast receiver to a muted state.

(b) Decoders shall be capable of operation within the tolerances specified in this section as well as those in 11.32(b), (c) and (d).

#### 11.34 Acceptability of the equipment.

(a) An EAS Encoder used for generating the EAS codes and the Attention Signal must be Certified in accordance with the procedures in Part 2, Subpart J, of this chapter. The data and information submitted must show the capability of the equipment to meet the requirements of this Part as well as the requirements contained in Part 15 of this chapter for digital devices.

(b) Decoders used for the detection of the EAS codes and receiving the Attention Signal must be Certified in accordance with the procedures in Part 2, Subpart J, of this chapter. The data and information submitted must show the capability of the equipment to meet the requirements of this Part as well as the requirements contained in Part 15 of this chapter for digital devices.

(c) The functions of the EAS decoder, Attention Signal generator and receiver, and the EAS Encoder specified in 11.31, 11.32 and 11.33 may be combined and notified as a single unit provided that the unit complies with all specifications in this rule section.

(d) Manufacturers must include instructions and information on how to install, operate and program an EAS Encoder, EAS Decoder, or combined unit and a list of all State and county FIPS numbers with each unit sold or marketed in the U.S.

(e) Waiver requests of the Certification requirements for EAS Encoders or EAS Decoders which are constructed for use at a broadcast station or subject cable system, but are not offered for sale will be considered on an individual basis in accordance with Part 1, Subpart G, of this chapter.

#### 11.35 Equipment operational readiness.

(a) Broadcast stations and subject cable systems are responsible for ensuring that EAS Encoders, EAS Decoders and Attention Signal generating and receiving equipment used as part of the EAS is installed so that the monitoring and transmitting functions are available during the times the broadcast station or cable system is in operation. Additionally, broadcast stations and subject cable systems must determine the cause of any failure to receive the required tests or activations specified in 11.61(a)(1) and (2). Appropriate entries must be made in the broadcast station log as specified in 73.1820 and 73.1840 of this chapter, cable system record in 76.305 of this chapter indicating reasons why any tests were not received.

(b) If the EAS Encoder or EAS Decoder becomes defective the broadcast station or subject cable system may operate without the defective equipment pending its repair or replacement for a period not in excess of 60 days without further FCC authority. Entries shall be made in the broadcast station log or subject cable system records showing the date and time the equipment was removed and restored to service. For personnel training purposes, the required monthly test script must still be transmitted even though the equipment for generating the EAS message codes, Attention Signal and EOM code is not functioning.

(c) An informal request may be made to the Engineer-in-

charge of the FCC field office serving area in which the broadcast station or subject cable system is located for additional time to complete repairs to the defective equipment. These requests must explain what steps have been taken to repair or replace the defective equipment, the alternative procedures being used while the defective equipment is out of service, and when the defective equipment will be repaired or replaced.

>

##### Stuff remove #####

How would this be different then a repeater rebroadcasting NOAA radio or the new EAS system using local repeater for paths.

I remember a broadcast about the EAS. The FCC man stated that this should not be a problem because this was emergency traffice. I do not see a differance.

Please check your contact at the FCC for rulings on the above cases.

After a recent family trip over the Thanksgiving day holiday weekend, I can personally attest to the APRS activity on VHF along I-75 from central Ohio down to Atlanta Georgia. I must admit that I was a little disappointed with the APRS coverage in certain areas, but was pleasantly surprised by the time we hit Knoxville Tennessee.

From there on into Atlanta the VHF activity picked up quite a bit. By the time we had crossed the Georgia state line I got my first message from the gang down in Atlanta (some 100 miles down to the south-east).

Once we had made our final destination, I setup the temporary shack with my HT, KPC-3, and laptop. Lo and behold, I was sitting right under a Wide-area Digi 2 or 3 miles to the south-east atop one of Atlanta's higher mountain tops. From then on, I was quite impressed.

With the HT, I was seeing stations on VHF as far north as Knoxville, as far south as southern Georgia, as far west as central Alabama (Hi Bill, saw you too), and as far east as the western & west central Carolina's.

Wow! What a network! This was very impressive compared to the

skimpy coverage I'm used to back home. So come on guys... (and gals) Ohio (Cleveland ? Very sparse down central Ohio way, Toldeo ? Mansfiled ? Never), Michigan (Rarely), Indiana (what happened to you guys?), WV (Never), Pennsylvania (only N3EOY). Let's get with it! These guys down south have put a lot of effort into there APRS network and its really paid off!

If I understood Ralph (N4NEQ) correctly, he said they saw me coming from Knoxville. Of course I was running HF on 10.151 simultaneously with VHF, but the gated position reports don't get through as fast and as often as the chatter I was hearing on the local repeaters once I got there.

The major areas of APRS activity seen along our way was, of course, central & south-western Ohio (Columbus to Cinnci), Lexington, Knoxville, and Atlanta. All-in-all though, we did have fairly good VHF coverage most of the way. Most likely due to band conditions, we had better VHF coverage on the way down than we did on the way back.

I do have complete track history files for all of the trip, so if anyone would like a copy of them please send me a PERSONAL E-Mail to jimk@on-ramp.net. It should at least give you some kind of idea what the coverage is like along I-75 if you're planning a trip along this route.

Additionally I do have available, for those who might be interested, 2 programs for working with downloaded GPS LTrack data and track history files. I had set the LTrack buffer in my KPC-3 before we left for home, but some how a lot of the data got scrambled.

I wrote "LTrack" to clean out this scrambled GPS data and a program called "Clean" for cleaning out the track history data I had saved along the way. I used this program to purge all stations other than mine from the track history data to some temporary files so I didn't have to wade through all the other stations just to see where I had been. Hi.Hi. It can also be used to purge just one station, if you like, for example to see everyone except yourself. Kinda useful I thought!

I wonder if anyone else has seen their LTrack data get scrambled? I can only presume that this happened due to an improper ground, and that the HF rig was getting into the KPC-3 somehow.

Also F.Y.I. - I have the 128K chip installed in my KPC-3 and it held 16,000 (that's sixteen thousand) lines of LTrack data. The data had an extra carriage return between every line of LTrack data, so in reality there was over 32,000 lines of data held in the buffer. I don't know if this is the exact nature of how the data comes out of the KPC-3's, or if was caused by the communications program I used to retrieve it.

Due to the scrambled nature of the data, I can't say for sure that this means anything. But I think it does say something for the amount of GPS data that can be held with the 128K chip.

One last thing before I go... With the configuration I had, I could see any, and all, VHF activity coming in on the laptop, but to the APRS community it would have looked as though I was running my GPS in a standalone mode. I ran it this way because my primary efforts on this trip were concentrated towards the local HF gate back home (KB8DP). Many people along the way tried to send me APRS messages on VHF, which did pop up on the screen. However, the way I had every thing configured I could not respond to any VHF messages that came in. If these people would have paid attention to the "raw\*" ID that they were receiving in my position reports they should have known I was running my VHF equipment in an "apparent" standalone mode.

The lesson to learn here is if you see "raw\*" coming in across the bottom of you screen with GPS position reports DO NOT try to send messages to these stations. They are not going to be able to respond to you. This only creates unnecessary traffic on the frequency. Your system will keep

trying to send out these messages with no hopes of ever  
getting an \*ACK\*.

>  
> Therefore, development on this project is now over.  
> I will provide the text of the ARRL response to the sig when I get it  
> (should be later today)  
>

Not at all. I think this is a very good application idea. Just think of  
another way of doing it so that it does fit into the rules.

Also -- don't forget that the rules are a living thing. If we find  
something that could be beneficial to amateur radio in what we do -- then we  
can go about it in legal ways to get modifications made to the rules to  
allow what we want to have done. Several things are involved here and I am  
sure others on the SIG can talk more in depth about them.

Don't let a little barrier like the rules as currently stated will not allow  
you to do it in your first concept -- kill it. That is the real fun about  
all this -- there are always lots of different ways to implement something.

If the tones can't affect what happens, then how could it be done so that  
the tones are only used as a data point.

As in the message I posted from Paul Newland, just using the tones is very  
limited. When another tone series begins, you have no clue to what the  
tones are associated with --- just that another alert is sounding.

So, when you first don't succeed, try, try again.

Cheers - Greg, WD5IVD

Rendered body type: text/plain

Whatever we do we need to decide what frequency we are going to use. I have  
seen reports of 6m activity on 50.620 and 50.610. Have been running 6m APRS  
during the E-skip of the last few days and have seen nothing, although I did  
connect with a node in Wisconsin from NW Texas and got into their 2m net and  
played around, so it can work.

I'll probably be flamed again, but oh well won't be the last time. What about  
a 2m and 6m weak signal (aka SSB) freq, It would be nice to have one to try  
for periods of E-skip, meteor showers, etc. And it might turn out to be a  
great beacon system!

On another note has anyone done or thought of tying a 6m rig in with a wide?  
I mean having a 2m rig and 6m rig running off of one single port TNC, so it  
will basically act as a dual freq node? I don't know if this will work or  
not, but any ideas are welcome.

Go ahead and flame and whine, cause I wear an asbestos suit all the time! I'm  
also qualified and licensed to remove it.

>I see way too many BLN s.....

I agree with this.. There are BLNs that get repeated DAY AFTER DAY AFTER DAY.. and this gets to be too much..

MacAPRS and WinAPRS currently do the following for MESSAGES...  
The messages get sent Once a minute for 5 minutes, then if still not acked, once a hour for 5 hours. (This is so that msgs that need to go via HF have a chance for propagation to change).

After that, The message dies.. Currently, BLNs are treated the EXACT same way. Which means that a message will at MAXIMUM transmit for 5 hours then stop. (This time limit of 5 hours IS user-setable, but the default is 5, and the software will NOT allow anything more than 24 to be entered)

Jim, just wanted to drop this line to you. Glad you got back ok. I had watched you off and on on your drive back north from Atlanta thru Knoxville, and up the side of the MTN above CARYVILLE. TN. I loved the Altitude data, for once I could use the Y axis in APRS and see the terrain as you traveled.

As info for you and other travelers heading south on I-75. As you Enter Tn heading South, you may want to change your beacons to either RELAY,WIDE,WIDE,N4NEQ-2 or WIDE,WIDE,N4NEQ-2. We are fortunate here to have 2 digi's at +3000 Ft ASL with coverage over most of the East TN valley. We still have some large holes in coverage along I-75 between Knoxville and Chattanooga but are working on those. By using the above unproto paths you should be able to be seen down into Atlanta. After you get to Chattanooga you may wish to change to just wide,wide or Wide, wide,TN. The TN will let use back up here In Knoxville see you.

Okay, Mike, now I am confused...where was the illegality...in the  
automated function of the beacon?

Certainly, If I am sitting at my APRS station and the WX alert goes off,  
and I issued a BLN1: Tornado Watch in effect for West Central Florida, I  
am not breaking any FCC rules. It is a temporary bulletin containing  
information of general interest to all amateur operators....and, BTW, it  
is also a transmission with regard to immediate protection of life and  
property...and could TECHNICALLY be called an emergency  
transmission...especially if it is a Tornado Warning, not just a watch.  
(All Tornado Warnings are issued "BULLETIN--EBS ACTIVATION REQUESTED.")

Message-ID: <30E425AB.6CDB@mec7804a.dukepower.com>  
Rendered body type: text/plain

Has anyone be able to get the U-2000 operating in the Remote Mode with Versions 74x of APRS? I connected my U-2000 to my TNC that is currently operating as Remote WX for a U-II. I turned the GPS feature off in the TNC and programed the U-2000 for Packet Mode. The Remote TNC transmits the following string every five minutes:

\$ULTW000000000008F000027DE0002CEBA0001036601670447

All of the above appears to be correct based on the documentation that I have read in APR's WX notes. There appears to be a problem with APRS when it tries to decode the message. As soon as APRS receives the above string, it bombs with an ERROR 6. I have tried this with both Ver. 74 and Ver. 74e. I also had another station monitor the channel and he reported the same problem with Ver. 74a. Thanks.

John, thats the same problem I'm haveing with the Pk12 - U 2000 and APRS74f. I get the output from the weather station the same as you do, but it is not decoded into meaningful weather data. Do you save the material in any way so that the weather portion is validated. We evidently are missing something. If you find a cure, let me know and I will do the same for you. I have been trying for weeks now but to no avail.

## 798. Space Mode & Dual -port TNC

From: MBTD87A@prodigy.com (MR MICHAEL R HESKETT)  
Date: Fri, 29 Dec 1995 13:57:27 EST  
To: aprssig@tapr.org  
Message-ID: <091.07561902.MBTD87A@prodigy.com>  
Rendered body type: text/plain

-- [ From: Mike Heskett \* EMC.Ver #2.10P ] --

Does anyone have any experience with with Space mode automatically triggering on a dual-port TNC. In my case a KPC-4 (2 VHFports).

I used a single port TNC (PK-12) and APRS 7.4b and it automatically fired the beacon upon seeing the spacecraft (R0MIR). Testing this with my KPC-4, APRS did not fire automatically. When I was successfully digipeated after manual intervention, APRS did go through the "SUCCESS"

routine.

I normally use Port 1 on the KPC-4 for APRS and then either turn off the radio on Port 2 ( or put it in voice mode).

I also tried "Controls/ 2port" without any luck.  
I wonder if there is a problem parsing the Unprotocol command for the spacecraft id, or is there something else I need to do.

In the KPC-4 the Unprotocol command has two parts - one for each port separated by a "/". Each port can be set independently of the other or they both can be set to the same thing. For example, with both ports set the same for me to digipeat through MIR, if you entered the "U" command, it would look like this:

UNPROTO EM12JU VIA R0MIR/EM12JU VIA R0MIR

Anyone have any experience with this or can experiment with it?

73 Mike  
WB5QLD

Cc: aprssig@tapr.org  
Message-ID: <951229183339\_26811124@mail04.mail.aol.com>  
Rendered body type: text/plain

Good day and Happy New Year!  
Here is the last in the installmet of comments I have recieved.  
My reply's are in caps.

Regarding your APRS severe weather notification system I would respectfully pose a few questions for your consideration.

-How many spotters/chasers have APRS?  
-If one's pager sounds off they would need to access a Wx Radio for immediate description of the event.  
-Why not just buy a pocket tone alert Wx radio and/or a desk model and have direct tone alerting and descriptions on your desk or in the palm of your hand? (Well -under- a \$100.00)

YOUR QUITE RIGHT. THE PURCHASE OF A HAND HELD  
WX RECIEVER WOULD FUNCTION VERY WELL. ALL IN ALL,  
I SEE NO PURPOSE AT THIS POINT TO THE APRS NET.  
IT ADDS A LEVEL OF COMPLEXITY TO THE SYSTEM AND  
NOT REDUNDANCY. PERHAPS THE LIGHTNING WARNING SYSTEM  
WOULD BE A BETTER PROJECT. THIS IS NOT SOMETHING THAT  
IS ROUTINLY REPORTED ON WX WARNINGS.

What I don't understand is why standard tone alert weather radios would not be your first choice, and how does the paging system add any value to severe weather notification?

-----  
THIS NOTE THAT FOLLOWS IS FROM THE ARRL, I SENT A FEW  
OF OUR NOTES TO THEM FOR COMMENTARY.

Thanks Mike. Just as a response to the first commentator, the difference between most of what he is mentioning and the NWS alert is that the NWS alert is generated because a human being decided to issue an alert. The alert carries information intended for other humans, and so it's third party information on amateur radio.

The other conditions the person cited, a rain gauge hooked to an APRS system, or a repeater changing certain items due to battery failure, are not generated by humans. Neither the rain gauge nor wind indicator nor the repeater battery monitor send their information for any purpose whatever. The closest thing to a human, informational, intent in either of those systems is that the station licensee/control operator has intentionally and legally programmed the system to AUTOMATICALLY respond to natural, not human generated, phenomena and report them. Telemetry, the transmission of measurement information, is certainly legal. Decoding and transmitting an NWS alert does not constitute a measurement.

By the way, all the comments you forwarded are very well thought out, and I appreciate your passing them on.

THE BOTTOM LINE IS:

I think we are dead in the water, and honestly dont feel bad about it. This system really would not help anyone more than the wx alert radios would. IF you want an alert, carry a radio...  
Im still in the mood to try and come up with a good application for aprs and these pic's.  
thanks again to everyone, arrl included for your helpful comments and keeping the sig nice and not too flamey (is flamey a word !?)  
Mike KD4EMI@AOL.COM

Rendered body type: text/plain

When ever I travel with APRS I usually find some things to change. This time, only one thing came up. THOSE REDICULUOUS PHG-RINGS!

You wouldn't believe some of the rings I saw in the southeast

Here is where I can change it a little bit.

Presently APRS caculates the more-or-less proper range based on HAAT but then bumps it up for added gain above 3 dB and again for added power over 10 watts.

The POWER factor clearly does NOTHING for receive which was my intent for the PHG rings anyway. This screws the range ring beyond reality when the owner puts up an aligator... For my next version, I am going to drop the POWER factor from the size of the range rings for all stations EXCEPT your own. This way you will see the RECEIVE range of all other stations and the TRANSMIT range of your own. If the circles overlap, then you will be tracked...

I spent my entire vacation in Atlanta, only 8 miles from a WIDE. My terrain was about average, and after trying the attic, roof, and then a line into the top of a 40 foot tree, I still could NOT even HEAR the WIDE at all. I finally got out via another home station, but without hearing a WIDE, I could not see any more than 1 to three neighbors. The WIDE PHG ring, of course went FAR beyond my location...

Don't be so quick to abandon your idea because one person, even a highly placed and allegedly "informed" person tells you that it is THEIR interpretation that your idea is illegal.

We went through the same bull with someone at the ARRL pronouncing FBB compressed packet forwarding illegal. Turns out, he was wrong, and only succeeded in screwing up our network forwarding system for a few months.

Their are two considerations:

1. The emergency exception, which may or may not apply.
2. What does "transmits because" mean?

Does the tone actually cause the transmission, or does the tone inform a program of an event and then the program makes a decision to transmit or not to transmit? Sometimes it doesn't hurt to mince words. Rules always tend to lag technology and innovation. The FCC has bent considerably in the past, pending new rules.

Don't give up so easily, just because one bureaucrat has issued an OPINION as to what HE INTERPRETS the regulations to mean.

We successfully fought an FCC Engineer in Charge on one of this issues.

So if you are really interested in the project, persevere.

Does anyone out there use a Dual Port Pico Packet and a Magellan Meridian GPS ?  
Would like to stay intouch with someone who currently uses these two units together to try to figure out some occasional "complications" we encounter. At work we have 3 dual port picos with 2 Meridians and 1 Garmin GPS-50. I have never had any problems using the Garmin so we are really confused. We have been trying to get everything to work 100% of the time since September now when we started with the single port version, but have run into various problems.

## 803. Win32s Upgrade for Win 3.1x

From: schiers@ibm.net (hasan schiers)  
Date: Sat, 30 Dec 95 02:16:22 EST  
To: aprssig@tapr.org  
Message-ID: <199512300224.CAA01810@smtp-gw01.ny.us.ibm.net>  
Rendered body type: text/plain

If you are running Win95 or WinNT, you do not need this file or info, as 32 bit mode is built in.

As mentioned on the Web page for WinAPRS, those of us running Windows 3.1x require the 32 bit subsystem referred to as Win32s installed in order to run the WinAPRS which is in beta testing now and is scheduled for release at Dayton.

I thought I would share my experience in getting the required file and installing on a system with no previous versions of Win32s installed.

The file name: OLE32S13.EXE (also get the readme.txt file in the same dir)

Where to get the file: ftp site is ftp.ncsa.uiuc.edu

The directory is: /Mosaic/Windows/Win31x/Win32s

The file is VERY LARGE at 3.07 megabytes. It is a self-extracting file that will set up disk images as directories. I had to use a utility called Pcopy in order to split it onto 3 diskettes to move it to the right machine (and of course to combine it after the split).

What follows is an annotated copy of the readme file that tells you how to go about either upgrading to version 1.30 of Win32s, or installing 1.30 on a system (like mine) that had not had Win32s previously installed.

\_\_\_\_\_ READ ME file begins here:

This directory contains Win32s with OLE v1.30a (1.30.166) and the address book DLL (AB.DLL) for Microsoft Mail. Win32s v1.30a is the latest and greatest version of Win32s. We recommend all Mosaic users upgrade to this version. When upgrading Win32s, we recommend you remove the old version of Win32s(v1.25a) and install v1.30a from scratch.

N.B. comments about Mosaic have nothing to do with WinAPRS, so don't\panic.

If you are a Microsoft Mail user, we also recommend you upgrade the AB.DLL in your /windows/system directory. The updated AB.DLL was supplied by Microsoft.

N.B. AB.DLL is not needed for WinAPRS

Below are instructions for removing and installing Win32s.

-----  
N.B. If you have never installed Win32s on your system, skip to the next section: Installing Win32s 1.30

Removing Win32s:

-----  
The following steps can be taken to remove Win32s v1.25a from your Windows 3.1x or Windows for Workgroups 3.1x environment.

1. Remove the following line from the [386Enh] section of your system.ini file. The sysedit.exe application in you /windows/system directory will open an ascii editor to all your system files.

device=C:\WINDOWS\SYSTEM\WIN32S\W32S.386

2. Modify the following line from the [BOOT] section in the SYSTEM.INI file:

drivers=mmsystem.dll winmm16.dll  
to the following (remove winmm16.dll):  
drivers=mmsystem.dll

3. Delete the following files from your c:\windows\system subdirectory or from the SYSTEM directory in network installations:

W32SYS.DLL  
WIN32S16.DLL  
WIN32S.INI

4. Delete all files in the c:\windows\system\win32s subdirectory.

5. Delete the c:\windows\system\win32s directory

6. Reboot your machine.

Your system is now Win32s free. You will not be able to run Win32 applications.

Installing Win32s v1.30

-----  
1. Download OLE32S13.EXE (3,072,788 Bytes) into a temporary directory. (ie. c:\install)

2. With the File Manager open the temporary directory. (where you placed your downloaded file OLE32S13.EXE)

3. Double click on OLE32S13.EXE (it will extract the files)

4. Double click on Install.bat (it will try to install, but for me failed, which was obvious in that no Win32s setup program appeared)

5. Follow the instructions from the setup program. (Be sure to let it install the game FreeCell, as running it will tell you if your install has been successful)

Win32s v1.30 is now installed and you will be able to run Win32

applications.

N.B. This procedure did not quite work right. Step 3 above extracted the archive and created the disk images in the proper directories. Install.bat, however, did not work properly, as it never put me into the Win32s setup program. I resolved this by restarting windows, opening up the file manager changing to the .\disk1 directory and executing setup.exe from the file manager in that directory.

What worked for me was to follow the directions as listed and then restart windows, open the file manager, change to the .\disk1 directory and execute setup.exe by double clicking on it. From there on it was a snap following the prompts of the Win32s installation setup screen.

This brought up the Win32 setup screen, and successfully installed Win32s ver 1.30, and installed the game freecell to test it. All went fine, and I was prompted to add share.exe to my autoexec.bat.

Now it is wait for a beta copy of WinAprs (if I get sent one), or for the first release due out around Dayton time.

I hope this will help someone who is worried about what is involved with the upgrade. It went very smoothly, once I figured out how to move a 3.07 mega-byte file from one machine to the other, and I worked around the flaw in the install program. 73,

robert "hasan" schiers

WB4APR REPLY COMMENT:

ANY mechanism that allows APRS to see its OWN packet will trigger the SUCCESS message. It can be audio loop back, or some TNC command that lets the TNC echo its own transmitted packets... Look at the VIEW screen and if you see your packets, then you have a problem....

Rendered body type: text/plain

David W. Barrow III sez:

>  
> Does LoranC have similiar inaccuracy built in?

Yes. Period. But not by "diddling." Because of the nature of the  
multi-station triangulation methods employed by LORAN-C, the wavelength, and  
the fact that \_most\_ of the stations are located next to extensive bodies of  
water, there's significant common mode error inherent in the system. While  
you can get 100-200 meter accuracies with LORAN-C (post-processed) that's  
what we're already seeing with GPS with SA on.

> Do I understand that Europeans are staying with LoranC to avoid  
> the US's "fiddle factor"?

A number of the European Community nations are already implementing nationwide  
DGPS systems (public) or satellite-based wide area augmentation systems  
(similar to the FAA's proposed methods). The European air traffic control  
system embraced GPS without correction for enroute navigation a couple of  
years before the US did. Some folks now are going to a combination of GPS  
and GLONASS (the Russian version) to compare results and enhance accuracy.

> Thanks VERY MUCH for educating the rest of us.

Ciao,  
Gerry

I've been chatting with a friend, KC40CG, about this... he's implemented a  
system for voice repeaters that retransmits a minute or so of the NWS audio

after a tone...read on for background on the equipment (which is similar to our APRS application) and his comments on the current discussion:

=====

THE EQUIPMENT From W5YI article (edited for brevity):

#### AMATEUR PATENTS NEW WEATHER RADIO RECEIVER Designed for Failure Situations, Stores Weather Warnings

Virginia emergency authorities convened a meeting in 1993 after devastating tornadoes swept through several communities in the state. Local emergency managers had not known about tornado warnings sent by the National Weather Service (NWS) until after they had started to respond to damage caused by the storms. They were desperate for a better link between the NWS and local authorities.

After two years of experimenting in his garage, Gropper has received a patent for the technology used in Weather Eagle 100, a NOAA Weather Radio scanner with sophisticated capabilities. The receiver is designed for use by emergency managers, police and fire departments as well as for use in public buildings such as churches, schools, shopping malls and theaters.

KC40CG studied the NWS NOAA Weather Radio system, which broadcasts tone-alert warnings and forecasts in the 162.4-162.55 MHz band from more than 400 transmitters across the country. Canada is protected by a similar system on the same channels. Though usually effective, NOAA Weather Radio is prone to breakdowns and "dead" carriers with no audio, he discovered.

A method had to be invented to switch a receiver to another Weather Radio channel if the carrier drops or if the carrier stays on with no sound. From analysis of 60 hours of transmissions, he designed signal processing technology optimized for Weather Radio. The receiver seeks the best of the seven possible channels, rescanning for the strongest signal once per minute. If the best frequency loses audio, it switches to the next best channel if one is available.

Another problem was that existing receivers and scanners had no way of storing warnings for later playback or broadcast. Gropper found that in many cases, warnings were broadcast, but officials were not present to hear them - sometimes with tragic consequences.

His receiver detects the weather alert tone, records the official alert broadcast in solid-state memory, time-and-date stamps the recording, and keys audible and/or visual alarms. It can retransmit the warning over public address loudspeakers, mobile radio systems and repeaters. "If the firemen want to replay the warning or hear one minute of live weather they press a DTMF speed dial key on their radio in the fire truck," Gropper told us. "That sends a signal back to our radio in the firehouse, which responds back over the fire channel with either message. They love it. It worked 10 times during tornadoes we had on October 5 in the Virginia Tidewater area."

"We had to add helical filters and a Gasfet preamp to allow the radio to survive reasonably high RF environments. It includes all of the controls to interface with a repeater, including a busy input to shut up the weather radio when there is an input on the repeater, and tone-detect logic to trip other alarms and macros when the warning comes in." If the repeater is busy, and a warning is received, the Weather Eagle will transmit eight beeps over the air to alert repeater users that a warning has been issued.

"I can envision this radio being in the studios of many radio stations in the midwest and southeast. It has the built-in ability to play (and replay) the digitally-recorded warning into an audio output as needed, so the DJ can make the announcement of a weather warning and the engineer can press the button instead of messing around with rereading the text or trying to tape the warning for replay."

Federal officials have announced plans to expand the use and coverage of NOAA Weather Radio. "Special emphasis will be placed on getting these radios installed in public gathering places so they will be as common as smoke detectors," Vice President Al Gore stated.

"Together with the Federal Emergency Management Agency, the Department of Agriculture, and the U.S. Geological Survey, NOAA Weather Radio will soon be transformed into an 'all hazards' radio network, making it the single source for the most comprehensive weather and emergency information available for all citizens," according to the NWS.

For his support of SKYWARN, KC40CG and his fellow ham volunteers received awards from Dr. "Joe" Friday, NWS Director (May 1994 QST, pg. 95). Dan looks forward to another achievement, he says: saving lives by getting severe weather warnings to public safety officials and citizens.

In fact, the awards ceremony in Washington was cut short - by a real SKYWARN activation for severe thunderstorms!

The Weather Eagle 100 Weather Radio Scanner, Recorder and Communications Interface lists for \$595.00 from Thunder Eagle, Inc., PO Box 625, Vienna VA 22183, 703 242 0122, thuneagle@aol.com.

=====  
KC40CG comments on my question about who is controlling the transmission:  
"Ah Yes!

That is a closer question, of technically who theoretically causes an amateur radio transmitter to transmit!

I am not the FCC, but here are my opinions. Take them for what they are worth??

The ultimate control person responsible for the transmission is the amateur radio licensee. Therefore there is a ham involved and responsible for the transmission, which is (in my opinion) the main intent of the FCC rules on this point.

The FCC, in the same Report and Order, stated their goal for flexibility in amateur radio communications by stating, "...we will rely on the amateur service's traditions of self-regulation and cooperation between licensees, the cornerstones of the amateur service, to determine whether specific communications should be transmitted on amateur service frequencies."

I treat the occurrence of an NWS alert tone the same as an automatic repeater site break in alarm, power failure alarm, temperature announcement, and club voice announcement, all of which are regularly automatically transmitted on amateur radio frequencies. In each instance the licensee has chosen to lend his license to the repeater controller to automatically transmit the detection of a changed condition.

In the NWS alert case, the licensee has chosen to detect the occurrence of a changed condition, that of the issuance of a potentially life saving alarm originated by a federal government entity, NWS, and transmitted on an official government frequency, NOAA Weather Radio, with the intent by the government to alert the public of the occurrence of potentially life and property threatening severe weather.

The FCC permits the retransmission of NOAA weather radio on private land mobile and emergency management frequencies. The FCC specifically permits the transmission of NOAA Weather Radio on Amateur Frequencies. The new FCC Emergency Alerting System (formerly Emergency Broadcast System) will retransmit NOAA Weather Radio. Vice President Al Gore has stated that "Special emphasis will be placed on getting these radios installed in public gathering places so they will be as common as smoke detectors." Therefore, the FCC and the federal government clearly understand the importance of NOAA Weather Radio and will likely support the integration of NOAA Weather Radio's automated alarm features into other communications systems, such as amateur radio.

Your earlier email had it correctly. When you may have seconds to get out of the way of a tornado, a warning ten minutes later will likely be way to late to be of any value.

Therefore, in my view, it is the amateur licensee who is originating the NWS alert transmission on amateur radio frequencies. It would be different if the NWS connected the two systems together, which they are not doing. All they are doing is issuing weather alerts. It is the amateur who is detecting the issuance of the alert and is causing the amateur radio transmitter to be keyed. It is the amateur who shuts down the retransmission if it malfunctions, not the NWS. It is the amateur who is responsible if the NWS alarm interferes with communication on the amateur frequencies, not the NWS.

So, I think such retransmission of NWS alerts is perfectly fine and should be accomplished in every possible manner. This is clearly based on the principals of amateur radio. Rule 97.1(a) states, "Recognition and enhancement of the value of amateur service to the public as a voluntary non commercial communication service, particularly with respect to providing emergency

```

NNNN

73, gerry

Actually its not over water paths but delay over land paths that degrade loran-c accuracy. While loran does not have the absolute accuracy of gps, it will usually allow a user to return to a given point closer than non-differential gps. Using both loran-c and gps but I never assume that either has more than 1/4 mile accuracy especially if they do not agree.

Rendered body type: text/plain

-- [ From: Mike Heskett \* EMC.Ver #2.10P ] --

Thanks Bob and James for the replies.

I may not have explained the problem correctly.

The problem is that APRS, in Space mode, does not automatically transmit when messages are received from the spacecraft id (R0MIR, in this case - or any other in testing) for my dual port KPC-4. It works fine on a single port TNC. I have defined my TNC as a KAM and as TAPR, with no difference. I have tested on both ports - no difference.

I know that UNPROTO is set correct because I can manually force transmissions with X B, and I have seen my packet digipeated from R0MIR.

It is as (but not necessarily) if APRS is not getting a match in the id of the spacecraft and what it is comparing against. I don't know how that comparison is tested but I can see how it might not work. If it is programmed to look at the return from a UNPROTO command and takes the characters after the "VIA " until the next space for my KPC-4 it would set the following as the id it would compare for:

R0MIR/EM12JU

or some other non-blank characters after the "/" because an UNPROTO command on my TNC returns both ports :

UNPROTO EM12JU VIA R0MIR/EM12JU VIA R0MIR

I have had a little trouble getting the Unproto set right. It works better if I enter space mode first then set the spacecraft id with the U command. Some of the docs mentions setting U first. I don't think that makes a difference, because I have tried it both ways, but it might. When I set the U first then enter Space mode, sometimes the via goes back to RELAY.

Thanks again:  
Mike

## 813. Wx

From: KD4EMI@aol.com  
Date: Sat, 30 Dec 1995 14:21:00 -0500  
To: aprssig@tapr.org  
Message-ID: <951230142058\_27380611@emout05.mail.aol.com>  
Rendered body type: text/plain

I have been following the wx discussions both pro and con.

Also, Ive taken the liberty of fwding the msgs to arrl.  
They could ask the fcc for a "ruling" I suppose.

But then the question remain,  
How is this better than a regular Wx alert radio...?  
If you are really concerned abt the wx, carry one !

Although the idea is a neat one, interfacing computer stamps and radios and the like, I think that adding a step into the system induces another chance of error. The other option is to have a wx radar or something like that at home (we have a guy down here with one) that senses bad wx (tornado's too ?) and then GENERATES the alert. Problem there is causing a panic...Would not be an official alert.

Another option is to have a HAM at the NWS generate an alert for the APRS group.  
We have a station at NWS running aprs, but not sure who is responsible for it...!  
So, Im playing around with building something else that we can play with. Frankly, I would not mind a cheaper peet bros type wx device. It slays me to pay over 300 bucks for a wx station... Perhaps I could work on that.. We'll see....  
Again, even if the FCC sent me a letter saying DO IT !  
I still think it adds another level of chaos into a system that could potentially not work. I would be devastated if people relied on this for wx warning and it failed.  
I'll keep trying to figure some way of automating something at NWS that I can link to the ham bands. Of course any ideas are invited.

## 814. Space Mode & Dual-Port TNC

From: MBTD87A@prodigy.com (MR MICHAEL R HESKETT)  
Date: Sat, 30 Dec 1995 15:40:34 EST  
To: aprssig@tapr.org  
Message-ID: <013.07615651.MBTD87A@prodigy.com>  
Rendered body type: text/plain  
-- [ From: Mike Heskett \* EMC.Ver #2.10P ] --

Bob (and others):

I think I found something that works. It does seem to require the path to be set before entering space mode. For this dual port to work, I have to enter the digi path in the saved paths and then set it with the O D commands, enter space mode and all is OK. If I set the path via th U command and then enter space mode, for some reason my path gets reset to what it was previously (but different).

It is like there is a save area somewhere that it goes back to.

Thanks again

Mike - WB5QLD

Maybe at some time in the future code could be written to make the bulletin behave more like navtext. Once you see a bulliten thats it, one time only on your screen. They could be saved to a bull file for review. Maybe you could delete particular bulls from that file, if they were of no use. I hate erasing the bulls only to have the computer beep again in an hour with the same bull!

Maybe an initial time stamp could identify them?

## 816. MFJ-8621 Crystals

From: William Richarz <wricharz@ix.netcom.com>  
Date: Sat, 30 Dec 1995 21:23:03 -0500

To: aprssig@tapr.org  
Message-ID: <199512310223.SAA08994@ix7.ix.netcom.com>  
Rendered body type: text/plain

Anyone out there have problems getting MFJ-8621 receive xtals for 145.79? This is the second one I have received from MFJ, and neither will adjust to the correct frequency, close but no cigar. Best I can do with the slug tuned all-the-way-out, is about 145.785 & I copy strong 145.77 stations, so guess the radio is broad as a barndoor too. Just wondering if MFJ has a bad batch of xtals on 145.79 receive? MFJ advises connecting Freq. Counter to pin 3 of the receiver chip and adjusting for 135.090 Mhz. for accurate tuning, but best I can do is 135.0867, a bit low. I would think I should do better than this.

Thanks for any replies.

Hay Bob, the only thing you need to change is your radio. Reference my previous message "APRS on I-75". All those stations I was seeing in Atlanta were with my HT & rubber duck! My height above average terrain was about ground zero, too.

There is certainly nothing wrong with the APRS network in Atlanta and there should have been no reason you weren't seeing any more than you did. Sure sounds to me like your radio needs a tune up. Hi.Hi.

WB4APR REPLY COMMENT:

No need, remember when you have a beam, you should be entering a DIRECTIVITY.

This offsets your PHG circle by a factor of about 2 in the favored direction. This is about the same as a 6 db additional gain. So unless your beam is greater than 15 dB then it is adequately represented.

And increasing the circle size much beyond about 9 dB makes little sense, because your range is more limited by the radio horizon than any amount of additional power (or bigger circle...)

WB4APR REPLY COMMENT:

Unfortunately, I came in the I-85 corridor and stayed in the South East near Conyers. Whenever I went mobile more than a few miles toward town, I got lots of packets. But in Conyers/Lithonia, trying four (4) different radios, and 4 different antennas, nothing could be heard...

Rendered body type: text/plain

Has the thought of writing APRS for Windows been discussed? I beleive it would increase the usefulness of APRS in that the user can resize or move a window over a large area map to zoom or look somewhere else in the net...

If you've ever played SimCity for Windows you'll understand where I'm going with this. Right now APRS works fine under windows, but doesn't take advantage of the Windows API and sometimes locks up (on Win 3.1, but I haven't tried it for long enuf on Win 95 to come to a conclusion) and doesn't run under multitasking as well as I would like to see it.

Rendered body type: text/plain

After having tried to make maps since APRS version 1.08 I have come up with several tricks for making or editing maps...maybe someone else can also add their techniques...

As discussed before: The smooth transition from one map to another (same magnification ,spelled "scale") involves making overlapping maps of adjacent areas. Often the same special features (locally important streets,features) must be transferred to a portion of each of the overlapping maps....

I've made a "work map" with the special features (streets etc) in a non-standard color and then transferred this non standard color to the overlapping maps..then when I'm satisfied I change the color of the transferred streets to the routine colors...

This prevents overlaying streets of the same color especially in high detail congested street maps like Boston (cow paths turned to streets and such)

Now, what slick tricks do you have??

William Richarz sez:

>

> Anyone out there have problems getting MFJ-8621 receive xtals for 145.79?

Don't have one, but...

> receiver chip and adjusting for 135.090 Mhz. for accurate tuning, but best I  
> can do is 135.0867, a bit low. I would think I should do better than this.

Any chance of padding the crystal with a small value cap? Couple of pf might bring you into range.

Good ? Rich! I too, have seen the beacons stating they were running  
74F. I looked and couldnt find it. Havnt looked in a few days. Think I  
will look now. See ya later.

Rich,

The beta2000.zip is on the DRIG ftp server at:

ftp.drig.com /pub/aprs

this is the APRS74F version.

WB4APR REPLY COMMENT:

There is no official 74f. It was the BETA2000 version that tried to fix  
the U-2000 problem. It did not work. Do NOT distribute it.

## 830. MFJ-8621 Crystals

From: jeff.brenton@espi.com  
Date: Sun, 31 Dec 95 22:23:53 -0500  
To: aprssig@tapr.org  
Message-ID: <9512312223.0VGR20E@espi.com>  
Rendered body type: text/plain

William Richarz asked if anyone else had problems tuning the  
MFJ-supplied crystals for the MFJ-8621. I did - they were HORRID, but I  
\*think\* I have them close. It was impossible to tune the set (I tried  
two) with the book method, and I haven't had access to a service  
monitor yet to check it, but I used the "ear" method to get it as close  
as I could.

To be honest, I don't think MFJ \*cares\* about the performance of the  
8621 on 145.790...
